## Graph Theory

Homework assignment \#3
Due date: Sunday, Jnuary 5, 2020

Problem 1. Let $G$ be a bipartite graph with bipartition $V(G)=A \cup B$. Define

$$
\delta(A)=\max _{S \subseteq A}(|S|-|N(S)|) .
$$

Prove that the maximum size of a matching in $G$ is $|A|-\delta(A)$.
Problem 2. An $n \times n$ Latin squere (resp. $r \times n$ Latin rectangle) is an $n \times n$ (resp. $r \times n$ ) matrix with entries in $\{1, \ldots, n\}$ such that no two entries in the same row or column are the same. Prove that if $r<n$, then every $r \times n$ Latin rectangle may be extended to an $n \times n$ Latin square.

Problem 3. Let $v$ be a vertex of a connected graph $G$ and, for $r \geqslant 0$, let $G_{r}$ be the subgraph of $G$ induced by the vertices at distance exactly $r$ from $v$. Show that

$$
\chi(G) \leqslant \max \left\{\chi\left(G_{r}\right)+\chi\left(G_{r+1}\right): r \geqslant 0\right\} .
$$

Problem 4. Let $G$ be a graph on $n$ vertices. Prove that $\chi(G) \cdot \chi(\bar{G}) \geqslant n$.
Problem 5. Suppose that a graph $G$ is a union of $k$ trees. Prove that $\chi(G) \leqslant 2 k$.
Problem 6. Suppose that every pair of odd cycles in a graph $G$ has a common vertex. Show that $\chi(G) \leqslant 5$.

## Please do NOT submit written solutions to the following exercises:

Exercise 1. Let $G$ be a connected graph with an even number of edges. Use Tutte's theorem to prove that the set of edges of $G$ can be partitioned into pairwise disjoint paths of length 2 .

Exercise 2. Prove that every bipartite graph with maximum degree $\Delta$ is a subgraph of some $\Delta$-regular bipartite graph. Use this fact to give another proof of König's theorem.

Exercise 3. A square matrix $A=\left(a_{i j}\right)$ of nonnegative real numbers is called doubly stochastic if the entries of each row and each column sum up to 1 , that is, for every $i$ and $j$,

$$
\sum_{i} a_{i j}=\sum_{j} a_{i j}=1 .
$$

A doubly stochastic matrix with all entries in $\{0,1\}$ is called a permutation matrix. Prove the Birkhoff-von Neumann theorem, which states that every doubly stochastic matrix is a convex combination of permutation matrices.
