In this paper we study modules over the ring $D$ of differential operators with polynomial coefficients on the space $R^{N}$ ．

An example of such a module is the space $S^{\prime}$ of generalized functions on $\mathbf{R}^{N}$ ．
To each $D-m o d u l e ~ M$ with a finite number of generators there corresponds．its carrier $\Delta(M)$ which is an algebraic submanifold in $C^{N} \times C^{N^{*}}$ ．In particular，to each generalized function $氏 \in S^{\prime}$ there corres－ ponds the manifold $\Delta(D(\mathscr{E}))$ ，where $D(\mathscr{E})$ is the submodule of $S^{\prime}$ generated by the function $\mathscr{E}$ ．

The first chapter is devoted to the study of the space $S_{0}^{\prime} \subset S^{\prime}$ ，which consists of generalized functions ${ }^{\mathscr{E}}$ ，for which $\operatorname{dim}(\Delta(D(\mathscr{C}))) \leqslant N$ ．

The main result of this chapter is the proof of the following theorem．
THEOREM A．Let $\mathscr{E} \in S_{0}^{\prime}$ ．We set $\Delta^{\prime}=\Delta(D(\mathscr{C})) \backslash \mathbf{C}^{N} \times 0$ and denote by $\Delta$ and $\tilde{\Delta}_{\mathbf{R}}$ the projections of the sets $\Delta^{\prime}$ and $\Delta^{\prime} \cap \mathbf{R N}^{N} \times \mathbf{R N}^{*}$ onto $\mathbf{C}^{N}$ ．Then
a） $\operatorname{dim}_{C} \tilde{\Delta}<\operatorname{dim}_{R} \widetilde{\Delta}_{R}<N$ ．
b） $\mathscr{E}$ is a real analytic function of the set $\widetilde{\Delta}_{R}$ ．
c）The function $\mathscr{C}$ has a continuation as a multivalued analytic function to the region $C \mathbb{N} \backslash \widetilde{\Delta}$ ．
d）The distinct branches of the function $\mathscr{E}$ generate a finite－dimensional linear space．
The proof of Theorem $A$ is based on the construction over the set $C N \backslash \widetilde{\Delta}$ of a certain algebraic bundle with an integrable connection，while the function $\mathscr{E}$ is a coordinate of its flat section．

In the first chapter it is also shown that the space $S_{0}^{\prime}$ is a $D$－module and is invariant under Fourier transform．

In the second chapter the following theorem is proved．
THEOREM B 。 Let $f$ be a generalized function on the line lying in the space $S^{\prime}$ ，and let P be a poly－ nomial on $\mathbf{R N}^{N}$ with real coefficients．Then the generalized function $f(\mathrm{P}) \in \mathrm{S}_{0}^{\prime}$ on $\mathbf{R}^{\mathrm{N}}$ ．

In $\S 7$ of Chapter 2 we use Theorem B to study the fundamental solutions of equations with constant coefficients．In particular，we prove the following theorem．

THEOREM C．Any linear differential operator $L$ with constant coefficients has a fundamental solu－ tion $\overline{\mathscr{E}_{L}}$ ，lying in $\mathrm{S}_{0}$ 。

COROLLARY．Assertions a），b），c），and d）of Theorem A hold for the function $\mathscr{E}_{L}$ ．

The author is glad for the opportunity to express his thanks to I. M. Gel'fand, who drew his attention to this subject. The problems posed by I. M. Gel'fand in his report at the Amsterdam congress (see [9]) form the basis for the present paper.

The author wishes to thank D. A. Kazhdan for reading the manuscript and making a number of useful remarks.

## CHAPTER 1

## Modules Over the Ring of Differential Operators and the Spaces $S_{i}^{\prime}$

1. The Carrier of a Module Over a Noncommutative Ring. The ring of differential operators with polynomial coefficients is naturally considered as an example of a noncommutative filtered algebra. We begin by studying a certain class of such algebras.

Let $D$ be an algebra with identity over the field $C$ and let $0=D^{-1} \subset D^{0} \subset \ldots D^{n} \subset \ldots$ be its filtration by subspaces with the following conditions satisfied:

A0. $\bigcup_{n=0}^{\infty} D^{n}=D$,
A1. $\mathrm{D}^{\mathrm{m}} \cdot \mathrm{D}^{\mathrm{n}} \in \mathrm{D}^{\mathrm{m}+\mathrm{n}}$,
A2. $\left[D^{m}, D^{n}\right] \subset D^{m+n-1}$,
A3. $1 \in \mathrm{D}^{0}$.
For $\mathscr{D} \in D$ we set $\operatorname{deg} \mathscr{D}=\min \left\{n \mid \mathscr{D} \in D^{n}\right\}$, $\operatorname{deg} 0=-\infty$. We introduce the notation $2(\mathrm{n})=\mathrm{D}^{\mathrm{n}} / \mathrm{D}^{\mathrm{n}-1}$ and $\Sigma^{(n)}=D^{n} / D^{n-1}$ и $\Sigma=\underset{n=0}{\infty} \Sigma^{(n)}$.

In $\Sigma$ a graded ring structure is introduced in a natural way (see [10]); $\Sigma$ is then a commutative ring with identity.

We will assume that the following conditions are satisfied:
A4. $\Sigma$ is a ring without zero divisors.
A5. $\Sigma$ is a finitely generated algebra over $C$.
Definition 1.1. 1. If $\mathscr{D} \in D$ then by $\sigma(\mathscr{D})$ we denote the element in $\Sigma(\mathrm{n})$ (where $\mathrm{n}=\operatorname{deg} \mathscr{X}$ ), which is the image of $\mathscr{D}$ under the mapping $\mathrm{Dn}^{\mathrm{n}} \boldsymbol{\Sigma}(\mathrm{n}) ; \sigma(0)=0$ 。
2. If $L$ is a linear subspace of $D$, then by $\sigma(L)$ we denote the linear subspace of $\Sigma$, generated by the elements $\sigma(\mathscr{D})$, where $\mathscr{D} \in L$.

Elements of the ring $D$ we call operators; if $\mathscr{D} \in D$, then the element $\sigma(\mathscr{D}) \in \Sigma$ we will call the symbol of the operator $\mathscr{D}$.

It is easy to verify the following lemma.
LEMMA 1.1. 1. If $\mathscr{D}_{1}, \mathscr{D}_{\mathbf{2}} \in D$, then

$$
\sigma\left(\mathscr{D}_{1} \mathscr{D}_{2}\right)=\sigma\left(\mathscr{D}_{1}\right) \cdot \sigma\left(\mathscr{D}_{2}\right) \text { and } \operatorname{deg}\left(\mathscr{D}_{1} \mathscr{D}_{2}\right)=\operatorname{deg} \mathscr{D}_{1}+\operatorname{deg} \mathscr{D}_{2} .
$$

2. If $L$ is a left ideal in $D$, then $\sigma(\mathrm{L})$ is an ideal in $\Sigma$.
3. If $L$ is a finite-dimensional subspace of $D$, then $\operatorname{dim} L=\operatorname{dim} \sigma(L)$.

Definition 1.2. We denote by $W$ the affine variety corresponding to the ring $\Sigma$ (see [6]). As a set, W coincides with the set of maximal ideals of the ring $\Sigma$.

Example. Let $V$ be a linear space over $C, D V$ the ring of differential operators with polynomial coefficients on $V, D \frac{n}{V}$ the space of operators of degree not greater than $n$. It is easy to verify that the ring DV satisfies conditions A0-A5, while $\Sigma$ is canonically isomorphic to the ring of polynomial functions on $\mathrm{W}=\mathrm{V} \times \mathrm{V}^{*}$, and $\sigma$ is the usual symbol of the operator.

Definition 1.3. 1. If $M$ is a $D-$ module,* $e_{1}, \ldots, e_{S} \in M$, then by $D\left(e_{1}, \ldots, e_{S}\right)$ we denote the $D$-submodule of $M$ generated by $e_{1}, \ldots, e_{S}$, and by $D^{n}\left(e_{1}, \ldots, e_{S}\right)$ the linear subspace of $M$ (over $C$ ), generated by the elements $\mathscr{T} e_{i}$, where $\mathscr{X} \in D^{\prime \prime}$.
2. The $D$-filtration $\left\{M^{n}\right\}$ in the $D$-module $M$ we call that filtration of $M$ by subspaces $0=M^{-1} \subseteq M^{0} \subset$ $\ldots \subset \mathrm{M}^{\mathrm{n}} \subset \ldots$, for which $\mathrm{D}^{\mathrm{m}} \cdot \mathrm{M}^{\mathrm{n}} \subset \mathrm{M}^{\mathrm{m}+\mathrm{n}}$ and $\bigcup_{n=0}^{\infty} M^{n}=M$.
3. Two D-filtrations $\left\{M^{n}\right\}$ and $\left\{\tilde{M}^{n}\right\}$ of the $D$-module $M$ will be called equivalent if there exists a number $k$, such that $M^{n} \subset \widetilde{M}^{n+k}$ and $\widetilde{M}^{n} \subset M^{n+k}$ for all n. $\dagger$

LEMMA 1.2. If $\mathrm{e}_{1}, \ldots \therefore \mathrm{e}_{\mathrm{q}}$ and $f_{1}, \ldots, f_{\mathrm{s}}$ are two systems of generators of the D -module M , then the D -filtrations $\left\{\mathrm{M}^{\mathrm{n}}\right\}=\left\{\mathrm{Dn}\left(\mathrm{e}_{1}, \ldots, \mathrm{e}_{\mathrm{q}}\right)\right\}$ and $\left\{\tilde{\mathrm{M}}^{\mathrm{n}}\right\}=\left\{\mathrm{D}^{\mathrm{n}}\left(f_{1}, \ldots, f_{\mathrm{S}}\right)\right\}$ are equivalent.

Proof. We choose $k$ such that $\mathrm{e}_{1}, \ldots, \mathrm{e}_{\mathrm{q}} \in \tilde{\mathrm{M}}^{\mathrm{k}}$ and $f_{1}, \ldots, f_{\mathrm{S}} \in \mathrm{M}^{\mathrm{k}}$. It is clear that $\mathrm{M}^{\mathrm{n}} \in \tilde{\mathrm{M}}^{\mathrm{n}}+\mathrm{k}$ and

Definition 1.4. If $e_{1}$, ..., $e_{S}$ is any system of generators of the $D$-module $M$, then the $D$-filtration $\left\{M^{n}\right\}=\left\{D^{n}\left(e_{1}, \ldots, e_{s}\right)\right\}$ will be called standard. It follows from Lemma 1.2 that all standard filtrations are equivalent.

PROPOSITION 1.3. Let $M$ be a finitely generated $D$-module, and let $L$ be a $D$-submodule of $M$. Then

1) $L$ is a finitely generated $D$-module.
2) If $\left\{M^{n}\right\}$ is the standard filtration of $M$, then the $D$ filtration $\left\{\tilde{L}^{n}\right\}=\left\{L \cap M^{n}\right\}$ is equivalent to the standard filtration $\{\mathrm{L}\}$.

COROLLARY. D is a Noetherian ring (see [10]).
Proof of the Proposition. We first consider the case in which $M$ is a free module with basis $e_{1}$, . . ., $e_{S}$. We put $M^{n}=D^{n}\left(e_{i}, \ldots, e_{S}\right)$ and consider the $\Sigma$-module $M_{\Sigma}=\bigoplus_{n=0}^{\infty} M_{\Sigma}^{(n)}$, where $M_{\Sigma}^{(n)}=M^{n} / M^{n-1}$. We define the mapping $\sigma: M \rightarrow M_{\Sigma}$ in analogy with Definition 1.1. The space $\sigma(\mathrm{L})$ is a $\Sigma$-module. Since the ring $\Sigma$ is Noetherian, it follows that $\sigma(L)$ contains a finite number of generators $v i$, which can be assumed to be homogeneous elements. Let $v_{i}=\sigma\left(u_{i}\right), u_{i} \in L$.

We will show that any element e $\in M^{n} \cap L$ belongs to $D^{n}\left(u_{i}\right)$. Suppose that this has been proved for all e $\in \mathrm{M}^{\mathrm{n}-1} \cap \mathrm{~L}$. We write $\sigma(\mathrm{e})$ in the form $\sigma(e)=\Sigma c_{i} v_{i}$, where the $c_{\mathrm{i}}$ are homogeneous elements of $\Sigma$ of degrees $\mathrm{n}-\operatorname{deg} \mathrm{v}_{\mathrm{i}} \leq \mathrm{n}$. Let $\mathscr{D}_{i} \in D$ be such that $\sigma\left(\mathscr{L}_{i}\right)=c_{i}$. Then $\mathscr{D}_{i} \in D^{n}, e-\sum \mathscr{D}_{i} u_{i} \in M^{n-1} \cap L$, and by hypothesis $e-\sum \mathscr{L}_{i} u_{i} \in D^{n-1}\left(u_{i}\right)$; hence $e \in D^{n}\left(u_{i}\right)$. The assertion of the lemma has now been proved for a free module $M$, since $D^{n}\left(u_{i}\right) \subset M^{n+k} \cap L$, where $k$ is the maximal degree of the elements $u_{i}$.

We now consider an arbitrary D -module M and a system of generators $\mathrm{e}_{1}, \ldots, \mathrm{e}_{\mathrm{s}}$. We denote by $\widehat{\mathrm{M}}$ the free D -module with generators $f_{1}, \ldots, f_{\mathrm{S}}$ and by $\tau$ the mapping $\tau: \widehat{\mathrm{M}} \rightarrow \mathrm{M}$, given by the formula $\tau\left(f_{i}\right)=e_{i}$. Let $\hat{\mathrm{L}}=\tau^{-1}(\mathrm{~L}) \subset \mathrm{M}$, let $\hat{u}_{\mathrm{i}}$ be the generators of $\hat{\mathrm{L}}$, chosen in the manner indicated above, and let $u_{i}=\tau\left(u_{i}\right)$. Then $u_{i}$ are the generators of $L$, and $L \cap M^{n}=\tau\left(\hat{L} \cap \widehat{M}^{n}\right) \subset \tau\left(\widehat{\mathrm{L}}{ }^{n}\right)=L^{n}$. Since $u_{i} \in M^{k}$ for some $k$, it follows that $L^{n} \subset L \cap M^{n+k}$. This completes the proof of the proposition.

Definition 1.5. Given a set of elements $e_{1}, \ldots, e_{S}$ in the $D$-module $M$, we denote by $\operatorname{Ann}\left(e_{1}, \ldots, e_{S}\right)$ the left ideal in D consisting of those operators $\mathscr{T}$, such that $\mathscr{D} e_{i}=0$ for all i .

PROPOSITION 1.4. Let the $D$-module $M$ be generated by the elements $e_{1}, \ldots, e_{S}$, and let $c$ be a homogeneous element in $\Sigma$. Then the following conditions are equivalent.

1. $c \in \operatorname{rad} \sigma\left(\operatorname{Ann}\left(e_{1}, \ldots, e_{S}\right)\right)$.
2. If $\mathscr{D} \in D$ is an operator such that $\sigma(\mathscr{D})=c$ and $\left\{\mathrm{M}^{\mathrm{n}}\right\}$ is the standard filtration of the module M , then for all $n \mathscr{D}^{k} M^{n} \subset M^{n+k d e g \mathscr{D}-q(k)}$, where $q(\mathrm{k})$ grows unboundedly together with $k$.
[^0]Proof. Since condition 2 does not depend on the choice of standard filtration, we will assume that $M^{n}=\bar{D}^{\mathbf{n}}\left(\mathrm{e}_{1}, \ldots, \mathrm{e}_{\mathrm{S}}\right)$.

Condition 2 is equivalent to the statement that for some $k \mathscr{D}^{k} M^{n} \subset M^{n+k d e g \mathscr{F}-1}$ for all $n$. Therefore, condition 2 depends only on $\sigma(\mathscr{F})$.
$1 \Rightarrow 2$. Let $c \in \operatorname{rad} \boldsymbol{c}\left(\operatorname{Ann}\left(e_{1}, \ldots, e_{s}\right)\right)$.
It is sufficient to verify condition 2 for the element $c p$ for some $p$. We choose $p$ such that $c p \in \sigma$ (Ann $\left(e_{1}, \ldots, e_{\mathrm{S}}\right)$ ), i.e., $\mathrm{c} p=\sigma(\mathscr{D})$, where $\mathscr{D} \in \operatorname{Amn}\left(e_{1}, \ldots, e_{5}\right)$.

Let $e=\sum \mathscr{D}_{i} e_{i}$, where $\mathscr{D}_{i} \in D^{n}$. Then

$$
\mathscr{D} e=\sum \mathscr{D D}_{i} e_{i}=\sum\left|\mathscr{D}, \mathscr{D}_{i}\right| e_{i} \in M^{n+\operatorname{deg} \mathscr{D}-1}
$$

Thus, $\mathscr{D} M^{n} \subset M^{n+\operatorname{deg} \not j^{-1}}$; i.e., $\mathrm{c}^{\mathrm{p}}$ satisfies condition 2.
$2 \Rightarrow 1$. Let c satisfy condition 2. We will show that for each element $f \in \mathrm{M}$ it is possible to construct an operator $\mathscr{D}_{f} \in D$, such that a) $\mathscr{D}_{f} \cdot f=0$; b) $\sigma\left(\mathscr{D}_{i}\right)$ is the degree of the element $c$.

Indeed, let $\mathscr{D} \in D$ be an element such that $\sigma(\mathscr{D})=c$, and let $L_{f}=D(f)$. Since the filtration $\left\{\tilde{L}_{f}^{n}\right\}=$ $\left\{L_{f} \cap \mathrm{M}^{\mathrm{n}}\right\}$ is equivalent to the standard one, it follows that $\mathscr{D}^{k} f \in D^{\text {sdeg }}{ }^{\text {det }}(f)$ for some k ; i.e., $\mathscr{D}^{k} f=\mathscr{D}^{\prime} f$, where $\operatorname{deg} \mathscr{D}^{\prime}<k \cdot \operatorname{deg} \mathscr{D}$. It is clear that the operator $\mathscr{D}^{k}-\mathscr{D}^{\prime}$ satisfies conditions a) and b).

We now consider the operators

$$
\mathscr{D}_{1}=\mathscr{D}_{E_{1}}, \mathscr{D}_{\mathrm{s}}=\mathscr{D}_{\mathscr{D}_{e_{2}}} \cdot \mathscr{D}_{1}, \ldots, \mathscr{D}_{\mathrm{s}}=\mathscr{D}_{\left(\mathscr{D}_{\mathrm{s}-1} \mathbb{R}_{\mathrm{s}}\right)}, \mathscr{D}_{\mathrm{s}-1} .
$$

Then $\mathscr{D}_{s} \in \operatorname{Ann}\left(e_{1}, \ldots, e_{s}\right)$, and $\sigma\left(\mathscr{D}_{s}\right)$ is the degree of the element $c$. Therefore, $\mathrm{c} \in \operatorname{rad} \sigma\left(\operatorname{Ann}\left(e_{1}, \ldots\right.\right.$, $\mathbf{e}_{\mathrm{s}}$ ).

Definition 1.6. 1. For any ideal $J$ in the ring $\Sigma$ we denote by $Z(J) \subset W$ the set of zeros of the ideal J (i.e., the set of all maximal ideals in $\Sigma$, which contain J).
2. Let $M$ be a finitely generated $D$-module. We put $J(M)=\operatorname{rad} \sigma_{(A n n}\left(e_{1}, \ldots, e_{S}\right)$ and $\Delta(M)=Z$ $\left(\sigma\left(\operatorname{Ann}\left(e_{i}, \ldots, e_{S}\right)\right)=Z(J)\right.$, where $e_{i}, \ldots, e_{S}$ is any system of generators of the module M.

It follows from Proposition 1.4 that $J(M)$ and hence $\Delta(M)$ are independent of the choice of system of generators. Indeed, $J(M)$ can be defined as the ideal in $\Sigma$, generated by homogeneous elements satisfying condition 2 of Proposition 1.4.

LEMMA 1.5. If $0 \rightarrow \mathrm{M}_{1} \rightarrow \mathrm{M} \rightarrow \mathrm{M}_{2} \rightarrow 0$ is an exact sequence of finitely generated D-modules, then $\Delta(\mathrm{M})=\Delta\left(\mathrm{M}_{1}\right) \cup \Delta\left(\mathrm{M}_{2}\right)$ and $\mathrm{J}(\mathrm{M})=\mathrm{J}\left(\mathrm{M}_{1}\right) \cap \mathrm{J}\left(\mathrm{M}_{2}\right)$.

Proof. It is sufficient to show that $J(M)=J\left(M_{1}\right) \cap J\left(M_{2}\right)$. Let c be a homogeneous element of $\Sigma$. We choose a system of generators $\mathrm{e}_{1}, \ldots, \mathrm{e}_{\mathrm{S}}$ in M and let $f_{1}, \ldots, f_{\mathrm{S}}$ be their images in $\mathrm{M}_{2}$. We introduce the standard filtrations $\left\{M^{n}\right\},\left\{M_{1}^{m}\right\}$, and $\left\{M_{2}^{n}\right\}$. It follows immediately from Propositions 1.3 and 1.4 that $J(M) \subset J\left(M_{1}\right) \cap J\left(M_{2}\right)$.

We now prove the reverse inclusion. Let $c \in J\left(M_{1}\right) \cap J\left(M_{2}\right)$. There exist a number $p$ and an operator $\mathscr{D} \in \operatorname{Ann}\left(f_{1}, \ldots, t_{s}\right)$, such that $\sigma(\mathscr{D})=c^{p}$. Then $\mathscr{D}\left(e_{i}\right) \in M_{1}$, and since $\sigma(\mathscr{D}) \in J\left(M_{1}\right)$, it follows that $\mathscr{D}^{k+1}\left(e_{i}\right)$ $\subset M_{1}^{\text {kdeg } \mathcal{Z}-q(k)} \subset M^{k d e g \mathcal{Z}-q^{\prime}(k)}$, where $q^{\prime}(\mathrm{k})$ grows unboundedly, together with k . Therefore, $\sigma(\mathscr{L})=c^{p} \in J(M)$ This means that $c \in J(M)$.
§2. Beginning in this section, the ring $D$ will be a ring of differential operators with polynomial coefficients on an $N$-dimensional complex linear space $V$ (see the example of $₹ 1$ ).

We fix a system of coordinates $x_{1}, \ldots, x_{N}$ in $V$ and a dual system of coordinates $y_{1}, \ldots, y_{N}$ in $V^{*}$.
We denote by $R$ the ring of polynomial functions on $V$ and by $\Sigma$ the ring of polynomial functions on $V \times V^{*}\left(R=C\left[x_{1}, \ldots, x_{N}\right], \Sigma=C\left[x_{1}, \ldots, x_{N}, y_{1}, \ldots, y_{N}\right]\right)$.

Each operator $\mathscr{D} \in D$ can be written in a unique way in the form $\mathscr{D}=\sum_{\alpha, \beta} c_{\alpha \beta}(\mathscr{D}) x^{\alpha}\left(\frac{\partial}{\partial x}\right)^{\beta}$, where
 and each element $c \in \mathbb{\Sigma}$ can be written uniquely in the form $c=\sum_{a, \beta} c_{a f i}(c) x^{\alpha} y^{\beta}$, where $y^{\beta}=y_{1}^{j_{1}} \cdot \ldots \cdot y_{N} N$.

In the ring $D$ we introduce the filtration $\left\{D^{n}\right\}$, by putting $D^{n}=\left\{\mathscr{D} \in D \mid c_{\alpha \beta}(D)=0\right.$ for $\left.|\beta|>n\right\}$.* The accompanying graded ring relative to this filtration is isomorphic to $\Sigma$. The mapping $\sigma: D \rightarrow \Sigma$ is given by the formula $c_{\alpha \beta}(\sigma(\mathscr{D}))=c_{\alpha \beta}(\mathscr{D}) \cdot \delta_{|\beta|}^{\operatorname{deg} \mathscr{D}}$, where $\delta$ is the Kronecker delta.

The affine manifold $W$, corresponding to the ring $\Sigma$, is isomorphic to $\mathrm{V} \times \mathrm{V}^{*}$. We denote by $\pi$ the natural projection $\pi: W \rightarrow V$.

We will consider $V$ as the complexification of the real linear space $V_{R}$. The coordinates $x_{i}$ will be assumed to be real.

We denote by $S$ the space of rapidly decreasing, infinitely differentiable differential forms of degree $N$ on $V_{R}$ and by $S^{\prime}$ the dual space of slowly increasing generalized functions (see [1]). We consider $S^{\prime}$ as a D-module (see [1]).

Definition 2.1. $\quad S_{i}^{\prime}=\left\{\mathscr{E} \in S^{\prime} \mid \operatorname{dim} \Delta(D(\mathscr{E})) \leqslant N+i\right\}$.
PROPOSITION 2.1. $S_{1}^{\prime}$ is a D-submodule of $S^{\prime}$.
Proof. Let $\mathscr{C}_{1}, \mathscr{C}_{2} \in S_{i}^{\prime}, \mathscr{D}_{1}, \mathscr{D}_{2} \in D$ and $\mathscr{C}=\mathscr{D}_{1} \mathscr{C}_{1} \cdots \mathscr{D}_{2} \mathscr{C}_{2}$.
It follows from Lemma 1.5 that

$$
\Delta(D(\mathscr{C})) \subset \Delta\left(D\left(\mathscr{C}_{1}, \mathscr{C}_{2}\right)\right) \subset \Delta\left(D\left(\mathscr{C}_{1}\right) \oplus D\left(\mathscr{C}_{2}\right)\right)=\Delta\left(D\left(\mathscr{C}_{1}\right)\right) \cup \Delta\left(D\left(\mathscr{C}_{2}\right)\right)
$$

Therefore, $\operatorname{dim} \Delta(D(\mathscr{C})) \leqslant N \therefore i$ i.e., $\mathscr{E} \in S_{i}^{\prime}$.
We proceed to the study of functions $\mathscr{\mathscr { E }} \in S_{0}{ }^{\prime}$. Each such function $\mathscr{E}$ satisfies a system of equations $I(\mathscr{C})=0$, where $I$ is some ideal in $D$ such that $\operatorname{dim} Z(\sigma(\mathrm{I})) \leq N$. We fix such an ideal I and int roduce the notation

$$
\Delta=Z(\sigma(I))=\Delta(D / I), \quad \Delta_{\mathbf{R}}=\Delta \cap\left(V_{\mathbf{R}} \times V_{\mathbf{R}}^{*}\right), \quad \bar{\Delta}=\pi(\Delta \backslash(V \times 0)), \quad \tilde{\Delta}_{\mathbf{R}}=\pi\left(\Delta_{\mathbf{R}} \backslash(V \times 0)\right)
$$

We note that $\operatorname{dim} \widetilde{\Delta} \leq N-1$, since the manifold $\Delta$ is given in $W$ by equations homogeneous in $\left\{y_{i}\right\}$.
THEOREM 2.2. Any solution $\mathscr{C} \in S^{\prime}$ of the system of equations $I(\mathscr{C})=0$ is analytic in the region $V_{R} \backslash \widetilde{\Delta}$.

Proof. Let $c_{1}, \ldots, c_{k} \in \sigma(I)$ be a choice of homogeneous elements which are simultaneously zero nowhere except on $\Delta$. By raising them to the appropriate power it can be assumed that $c_{1}, \ldots, c_{k}$ have the same degree of homogeneity $n$. Let $\mathscr{D}_{1}, \ldots, \mathscr{D}_{k} \in I$ be elements such that $\sigma\left(\mathscr{D}_{i}\right)=c_{i}$.

We consider the operator $\mathscr{D}=\Sigma \overline{\mathscr{D}}_{i} \mathscr{D}_{i} \quad$ (here $\overline{\mathscr{D}}_{i}$ is obtained from $\mathscr{D}_{i}$ by replacing all the coefficients by their complex conjugates)。 $\mathscr{D}$ has order 2 n , and $\sigma(\mathscr{D})=\sum \sigma\left(\mathscr{\mathscr { D }}_{i}\right) \sigma\left(\mathscr{D}_{i}\right)=\sum \bar{c}_{i} c_{i}$, On the set $\mathrm{V}_{\mathrm{R}} \times$ $\mathrm{V}_{\mathrm{R}}^{*} \backslash \Delta_{\mathrm{R}}$ this symbol is nonzero. Therefore, the operator $\mathscr{D}$ is elliptic off the set $\tilde{\Delta}_{\mathrm{R}}$ (see [7]). Since $\mathscr{D}(\mathscr{C})=0$, it follows from Theorem 7.5 .1 of [7] that $\mathscr{E}$ is an analytic function off $\widetilde{\Delta}_{R}$. This completes the proof of the theorem.

We now study the analytic continuation of the function $\psi$. We denote by $\Omega$ a connected component of the set $V_{R} \backslash \tilde{\Lambda}_{R}$.

THEOREM 2.3. 1. Any solution $\mathscr{E}$ of the system $I(\mathscr{E})=0$ can be continued analytically from the set $\Omega$ to the set $V \backslash \widetilde{\Delta}$ as a multivalued analytic function.
2. In a neighborhood of any point $x \in V \backslash \tilde{\Delta}$ all the a nalytic solutions of the system $I(\mathscr{C})=0$ from a finite-dimensional space.

COROLLARY. The multivalued function obtained as the analytic continuation of $\mathscr{E}$ is finitely dependent, i.e., all its branches are linear combinations of a finite number of branches.

Proof of the Theorem, We consider the module $M=D / I$ as an $R-m o d u l e$. Let $U$ be an arbitrary open affine subset of $V \backslash \widehat{\Delta}$, (see [6]), and let $R_{U}$ be the ring of regular functions on $U$. We study the behavior of the function $\mathscr{C}$ in the region $U$.

[^1]LEMMA 2.4. For each such set $U$ the module $M_{U}=R_{U} \underset{R}{\otimes} M$ has a finite number of generators as an $R_{U}$-module.

Proof. We consider elements $e_{1}, e_{2}, \ldots, \in M$, which are images of operators ( $\left.\partial / \partial \mathrm{x}\right)^{\beta}$ under the mapping $D \rightarrow M$. They generate $M$ as an $R$-module. We consider the set $\pi^{-1}(\mathrm{U}) \subset \mathrm{V} \times \mathrm{V}^{*}$ and the ideal $\sigma_{\mathrm{U}}(\mathrm{I})$ in the ring of regular functions on it generated by $\sigma(\mathrm{I})$. Since $\mathrm{Z}(\sigma \mathrm{U}(\mathrm{I})) \subset \mathrm{U} \times 0$, it follows from Hilbert's Nullstellensatz* that there exists a number m such that $y^{\beta} \in \sigma_{U}(\mathrm{I})$ for $|\beta|>\mathrm{m}$. This implies that the RUmodule $M_{U}$ is generated by the images of the operators $(\partial / \partial x) \beta_{\text {with }}|\beta| \leq \mathrm{m}$.

We choose a system of generators $e_{1}=1, e_{2}, \ldots, e_{k}$ of the $R_{U}$-module $M_{U}$. Then for any $i$ and $j$

$$
\frac{\partial}{\partial x_{i}}\left(e_{j}\right)=\sum_{l=1}^{k} A_{i j}^{l} e_{l}, \text { where } A_{i j}^{l} \in R_{U}
$$

Now let $\mathscr{\varepsilon}$ be an analytic solution of the system $I((\varepsilon)=0$ in (an analytic) neighborhood of the point $\mathrm{x} \in \mathrm{U}$. We consider the vector-valued function $\left\{\mathscr{C}_{j}\right\}=\left\{e_{j}(\mathscr{E})\right\}, j=1,2, \ldots, k$. It satisfies the system of equations

$$
\begin{equation*}
\frac{\partial}{\partial x_{i}}\left(\mathscr{C}_{j}\right)=\sum_{l=1}^{k} A_{i j}^{l} \mathscr{C}_{l}(1 \leqslant \mathrm{j}, l \leqslant k, 1 \leqslant i \leqslant N) . \tag{*}
\end{equation*}
$$

The next lemma is proved by standard methods from the theory of ordinary differential equations.
LEMMA 2.5. In a simply connected region $V_{0}$ of the complex linear space $V$ with coordinates $X_{1}$, $\ldots, x_{N}$ let there be given the system of equations $\left(^{*}\right)$, where the $A_{i j}^{l}$ are analytic functions in $V_{0}$. Then:

1. If the system $\left(^{*}\right)$ has an analytic solution $\hat{\mathscr{E}}=\left(\mathscr{E}_{1}, \ldots, \mathscr{E}_{k}\right)$ in a neighborhood of the point $\mathrm{x} \in \mathrm{V}_{0}$, then this solution can be continued analytically to the entire region $V_{0}$.
2. Each analytic solution $\hat{\mathscr{E}}$ of the system ( $*$ ) in the region $\mathrm{V}_{0}$ is defined by its value at the point x (in particular, the dimension of the space of such solutions does not exceed $k$ ).

Each point $x \in V \backslash \tilde{\Delta}$ is contained in an affine neighborhood $U_{x} \subset V \backslash \tilde{\Delta}$. Therefore, Theorem 2.3 is easily deduced from Lemmas 2.4 and 2.5.
§3. In this section we shall give a certain method of computing $\operatorname{dim} \Delta(M)$ for the $D$-module $M$.
In the ring $D$ we introduce the filtration $\left\{D_{1}^{\text {n }}\right\}$, by putting

$$
D_{\mathbf{1}}^{n}=\left\{\mathscr{D} \in D \mid c_{\alpha \beta}(\mathscr{D})=0 \text { for }|\alpha| \div|\beta|>n\right\} .
$$

If $\mathscr{D} \in D$, then $\sigma_{1}(\mathscr{D}) \in \Sigma$, and

$$
c_{a \tilde{j}}\left(\sigma_{1}(\mathscr{D})\right)=c_{\alpha, \beta}(\mathscr{D}) \cdot \delta_{|\alpha|+|3|}^{\operatorname{deg}_{1} \mathcal{D} \mid} .
$$

Similarly, we define in $\Sigma$ the filtration $\Sigma_{1}^{n}$ and the symbol by putting $\tilde{\sigma}_{1}: \Sigma \rightarrow \Sigma$ :

$$
\Sigma_{1}^{n}=\left\{c \in \Sigma \mid c_{\alpha \beta}(c)=0 \text { for } \quad|\alpha|+|\beta|>n\right\}, \quad c_{\alpha \beta}\left(\tilde{\sigma}_{1}(c)\right)=c_{\alpha \beta}(c) \cdot \delta_{|\alpha|+|\beta|}^{\mathrm{deg}} .
$$

The filtrations $\left\{D_{1}^{n}\right\}$ and $\left\{\Sigma_{i}^{n}\right\}$ are convenient, since all the spaces $D_{i}^{n}$ and $\Sigma_{i}^{n}$ are finite dimensional.
Definition 3.1. 1. Let $M$ be a $D$-module (or a $\Sigma$-module), and let $e_{1}$, . . ., $e_{s}$ be its system of generators. We put $d_{1}^{n}(M)=\operatorname{dim} D_{1}^{n}\left(e_{1}, \ldots, e_{S}\right)$ (respectively $\operatorname{dim} \Sigma_{1}^{n}\left(e_{1}, \ldots, e_{S}\right)$.
2. If $L$ is a subspace of $D$ (or of $\Sigma$ ), then we set $L_{1}^{n}=L \cap D_{1}^{p}$ (respectively $L \cap \Sigma_{1}^{n}$ ).

It is easy to verify that if $I$ is an ideal in $D$ and $M=D / I$, then $d_{1}^{n}(M)=\operatorname{dim} D_{1}^{n}-\operatorname{dim} I_{1}^{n} \cdot \dagger$
THEOREM 3.1. Let $M$ be a finitely generated $D$-module. Then the following conditions are equivalent:

[^2]1. $\operatorname{dim} \Delta(M) \leq m\left(\Delta(M)\right.$ is constructed with the filtration $\left.D^{M}\right)$.
2. $\mathrm{d}_{1}^{\mathrm{n}}(\mathrm{M})=\mathrm{O}\left(\mathrm{n}^{\mathrm{m})}\right.$.*

It follows from Lemma 1.5 that it is sufficient to consider the case $\mathrm{M}=\mathrm{D} / \mathrm{I}$.
For the proof of Theorem 3.1 we need an analogous result for the ring $\Sigma$.
PROPOSITION 3.2 (see Theorems 41 and 42 of [2]). If $J$ is an ideal in $\Sigma$, then $d_{1}^{n}(\Sigma / J)$ is a polynomial in $n$ for large $n$. The degree of this polynomial is equal to $\operatorname{dim} Z(J)$.

We proceed to the proof of Theorem 3.1.
$2 \Rightarrow 1$. It is easy to verify that $\sigma\left(\mathrm{I}_{1}^{\mathrm{n}}\right) \subset \sigma(\mathrm{I})_{i}^{\mathrm{n}}$. Therefore, $\operatorname{dim} \sigma(\mathrm{I})_{1}^{\mathrm{n}} \geq \operatorname{dim} \sigma\left(\mathrm{I}_{1}^{\mathrm{n}}\right)=\operatorname{dim} \mathrm{I}_{1}^{\mathrm{n}}$, whence $\mathrm{d}_{1}^{n}(\Sigma / \sigma(\mathrm{I})) \leq \mathrm{d}_{1}^{\mathrm{n}}(\mathrm{D} / \mathrm{I})=\mathrm{O}\left(\mathrm{n}^{\mathrm{m}}\right)$. It follows from Proposition 3.2 that $\operatorname{dim} \Delta(\mathrm{M}) \leq \mathrm{m}$.
$1 \Rightarrow 2$. In order to prove this implication, we introduce in the ring $D$ a countable number of filtrations $\left\{D_{k}^{n}\right\}$ such that $\operatorname{dim} D_{k}^{n}<\infty$ and for large $k$ the filtrations $\left\{D_{k}^{n}\right\}$ approximate the filtration $\left\{D^{n}\right\}$. Namely, we set

$$
D_{k}^{n}=\left\{\mathscr{D} \in D \mid c_{a} ;(\mathscr{D})=0 \text { for }|\alpha|+k|\beta|>n\right\}
$$

and define the mapping $\sigma_{\mathrm{k}}: \mathrm{D} \rightarrow \Sigma$ by the formula $c_{\alpha, \beta}\left(\sigma_{k}(\mathcal{Z})\right)=c_{\alpha_{j}}(\mathscr{D}) \cdot \delta_{[\alpha|\cdots k| j \mid}^{\operatorname{deg}_{k} \mathcal{Z}}$. Similarly, we define filtrations $\Sigma_{k}^{n}$ of the ring $\Sigma$. If $I(J)$ are ideals in $D$ (in $\Sigma$ ) then we define $d_{k}^{n}(D / I)$ [respectively $\left.d_{k}^{n}(\Sigma / J)\right]$ in analogy with Definition 3.1.

We note that the assertions $\left\{\mathrm{d}_{\mathrm{k}}^{\mathrm{n}}(\mathrm{D} / \mathrm{I})=\mathrm{C}\left(\mathrm{n}^{m}\right)\right\}$ and $\left\{\mathrm{d}_{1}^{\mathrm{n}}(\mathrm{D} / \mathrm{I})=\mathrm{C}\left(\mathrm{n}^{\mathrm{m}}\right)\right\}$ are equivalent for any k . Indeed, $D_{k}^{n} \subset D_{1}^{\mathrm{n}} \in D_{k}^{k n}$, whence $d_{k}^{n}(D / \mathrm{I}) \leq d_{1}^{\mathrm{n}}(\mathrm{D} / \mathrm{I}) \leq \mathrm{d}_{\mathrm{k}}^{\mathrm{kn}}(\mathrm{D} / \mathrm{I})$.

A similar argument shows that $\mathrm{d}_{\mathrm{k}}^{\mathrm{n}}\left(\Sigma / / \sigma_{\mathrm{k}}(\mathrm{I})\right) \leq \mathrm{d}_{\mathrm{i}}^{\mathrm{n}}\left(\Sigma / \sigma_{\mathrm{k}}(\mathrm{I})\right)$. Since $\mathrm{d}_{\mathrm{k}}\left(\Sigma / \sigma_{\mathrm{k}}(\mathrm{T})\right)=\mathrm{d}_{\mathrm{k}}^{\mathrm{n}}(\mathrm{D} / \mathrm{I})$, for the proof of the implication $1 \Rightarrow 2$ it is sufficient to verify that $d_{1}^{n}\left(\Sigma / \sigma_{k}(\mathrm{I})\right)=\mathrm{C}\left(\mathrm{n}^{\mathrm{m}}\right)$ for some k .

It follows from Proposition 3.2 that $d_{1}^{n_{( }}(\Sigma / \sigma(\mathrm{T}))=O\left(\mathrm{n}^{m}\right)$. This means that $\mathrm{d}_{1}^{\mathrm{n}}\left(\Sigma / \tilde{\sigma_{i}} \sigma(\mathrm{I})\right)=\mathrm{d}_{1}^{\mathrm{n}}(\Sigma / \sigma(\mathrm{I}))=$ $O\left(n^{m}\right)$.

Thus, for the proof of the implication $1 \Rightarrow 2$ it is sufficient to show that $\sigma_{k}(\mathrm{I}) \supset \tilde{\sigma}_{1} \sigma$ (I) for some $k$.
Let $\mathscr{D}_{i} \in I$ be operators such that the elements $\tilde{\sigma}_{1} \sigma\left(\mathscr{D}_{i}\right)$ generate the ideal $\tilde{\sigma}_{1} \sigma(\mathrm{I})$. We take $\mathrm{k}=\max$ $\operatorname{deg}_{i}\left(\mathscr{D}_{i}\right)$. It is then easy to verify that $\tilde{\sigma}_{1} \sigma\left(\mathscr{D}_{i}\right)=\sigma_{k}\left(\mathscr{D}_{i}\right)$, i.e., $\sigma_{\mathrm{k}}(\mathrm{I}) \supset \tilde{\sigma}_{i} \sigma(\mathrm{I})$. Therefore, $\mathrm{d}_{1}^{\mathrm{n}}\left(\Sigma / \sigma_{\mathrm{k}} \mathrm{I}\right) \leq \mathrm{d}_{1}^{\mathrm{n}}$ $\left(\Sigma / \widetilde{\sigma}_{1} \sigma(\mathrm{D})\right)=O\left(\mathrm{n}^{\mathrm{m}}\right)$. This completes the proof of Theorem 3.1.

COROLLARX 3.3. Let there be given an automorphism $\omega$ of the algebra $\mathrm{D}, \mathrm{D}$-modules $\mathrm{M}_{1}$ and $\mathrm{M}_{2}$, and a linear (over C) isomorphism $\mathrm{F}: \mathrm{M}_{1} \rightarrow \mathrm{M}_{2}$ such that $F \mathscr{D}=\omega(\mathscr{D}) F$ for any operator $\mathscr{D} \in D$. Then for any element $e \in M \operatorname{dim} \Delta(D(e))=\operatorname{dim} \Delta(D(F e))$.
 Therefore, $F\left(D_{1}^{n}(e)\right) \subset D_{1}^{k n}(F e) \subset F\left(D_{1}^{k^{2} n}(e)\right)$, i.e., $d_{n}^{1}(D(e)) \leq d_{i}^{k n}(D(F e)) \leq d_{1}^{k^{2} n}(D(e))$. It follows from Theorem 3.1 that $\operatorname{dim} \Delta(D(e))=\operatorname{dim} \Delta(D(F e))$.

Example 1. Let $\tilde{\omega}$ be an invertible polynomial mapping $V \rightarrow V$, with $\omega\left(V_{R}\right)=V_{R}$. We put $M_{1}=M_{2}=S^{\prime}$ and denote by $\omega$ and $F$ the automorphisms of $D$ and $S^{\prime}$ induced by the mapping $\tilde{\omega}$. Corollary 3.3 shows that $F\left(S_{i}^{\prime}\right)=S_{i}^{\prime}$ 。

Example 2. We put $M_{1}=M_{2}=S^{\prime}$. Let $F$ be Fourier transformation with respect to the variables $x_{1}, \ldots, x_{k}(k \leq N)$ and let $\omega$ be given by the formulas

$$
\left\{\omega\left(x_{j}\right)=-i \frac{\partial}{\partial x_{j}}, \omega\left(\frac{\partial}{\partial x_{j}}\right)=-i x_{i} \text { for } j \leqslant k ; \omega\left(x_{i}\right)=x_{i}, \omega\left(\frac{\partial}{\partial x_{j}}\right)=\frac{\partial}{\partial x_{j}} \text { for } j>k\right\} .
$$

It is easy to verify (see [1]) that the conditions of Corollary 3.3 are satisfied. Thus, we obtain
COROLLARY 3.4. If $F: S^{\prime} \rightarrow S^{\prime}$ is Fourier transformation with respect to part of the variables, then $\mathrm{F}\left(\mathrm{S}_{\mathrm{i}}^{\prime}\right)=\mathrm{S}_{\mathrm{i}}^{\prime}$ for all i .

[^3]
## The Functions $f(P)$

§4. We fix a polynomial $P$ with real coefficients on $V_{R}$. Let $f$ be a generalized function on the line. We wish to study a system of equations which the function $f(\mathrm{P})$ satisfies on $\mathrm{V}_{\mathrm{R}}$.

We first define what we mean by the function $f(\mathrm{P})$. We introduce the notation: T is the line, t is the coordinate on $T ; R T=C[t] ; D_{T}$ is the ring of differential operators with polynomial coefficients on $T$ with the filtration $\left\{\mathrm{D}_{\mathrm{T}}^{\mathrm{n}}\right\}$ with respect to the degree of the operators. The derivatives ( $\partial \mathrm{P} / \partial \mathrm{xi}$ ) we denote by $P_{i}$.

We set sing $P=\left\{x \in V \mid P_{i}(x)=0\right.$ for all $\left.i\right\}$. As is known, $P($ sing $P) \subset T$ is a finite set.
We fix an open region $\Theta \subset V_{R}$ such that $P(\partial \Theta)$ is a finite set ( $\partial \Theta$ is the boundary of the region $\left.\Theta\right)$. We set $\Omega=P(\Theta) \backslash P(\partial \Theta) \backslash P($ sing $P \cap \Theta) . \bar{\Omega}$ is the closure of $\Omega, \partial \Omega=\bar{\Omega} \backslash \boldsymbol{\Omega}$.

Definition 4.1. We denote by $C$ the space of continuous functions on $\Omega$ and consider the mapping $\eta$ : $S \rightarrow C$ defined as follows: if $\varphi \in S, t_{0} \in \Omega$, then we set

$$
\eta(\varphi)\left(t_{0}\right)=\int_{P-\psi\left(t_{0}\right) \cap \Theta} \omega,
$$

where $\omega$ is the differential form of degree $\mathrm{N}^{-1}$ on the manifold $\mathrm{P}^{-1}\left(\mathrm{t}_{0}\right) \cap \Theta$, such that $\omega \wedge \mathrm{dP}=\varphi$ (see [1], Ch. 3, §4).

PROPOSITION 4.1. If $\varphi \in S$, then $\eta(\varphi)$ is an infinitely differentiable function on $\Omega$, which is rapidly decreasing at infinity. In a neighborhood of each point $h \in \partial \Omega \eta(\varphi)$ admits a representation of the form $\eta(\varphi)=\sum \varphi_{i}(z) \cdot f_{i}(z)$, where $\varphi_{\mathrm{i}} \in \mathrm{C}^{\infty}(\mathrm{T})$, and $\left\{f_{\mathrm{i}}\right\}$ is a fixed (independent of $\varphi$ ) finite set of functions of the form $f_{i}=\left(\ln \left|z \|^{k i}\right|_{z} \mid r_{i}, 0 \leq k_{i} \leq N-1, r_{i} \in Q\right.$. (Such an expansion is possible separately in a right and left neighborhood of the point $h ; z$ is a local parameter in this neighborhood.)

The proof does not differ essentially from arguments given in [3] and [4]; we therefore only sketch the proof.

The definition of $\eta(\varphi)$ is first generalized to the case in which X is a nonsingular algebraic manifold, $P$ is a rational function on $X$, and $\varphi$ is an infinitely smooth complex-valued measure on $X$. Since $V$ is imbedded in a projective space $X$ of dimension $N$, the original problem reduces to the analogous problem for a compact manifold $X$. Using the theorem of Hironaka on the resolution of singularities (as is done in [3] and [4]) and then localizing the problem by means of a partition of unity, the problem can be reduced to the following case: $\mathrm{X}=\mathbf{R}^{N}, P=x_{11}^{i_{1}} \cdot \ldots \cdot x_{N}^{i_{N}}, \Theta=\left\{\mathrm{x} \in \mathrm{R}^{\mathrm{N}} \mid \mathrm{x}_{\mathrm{i}}>0\right.$ for all i$\}, \varphi$ is an infinitely differentiable form with compact support (the numbers $i_{k} \in Z$ are not necessarily positive). In this case $\eta(\varphi)$ can be described directly (see [1], Ch. 3, §4).

Definition 4.2. 1. We denote by $\mathrm{C}^{\mathrm{k}}$ the space of k times continuously differentiable functions $f$ on $\bar{\Omega}$ such that $f^{(i)}(h)=0$ for $h \in \partial \Omega, i=0,1, \ldots, k$, and $v_{k}(l)=\sup _{t \in \Omega}\left(\left(1 \div|t|^{k}\right) \cdot\left(\sum_{i=0}^{k}\left|f^{(i)}(t)\right|\right)\right)<\infty \quad$ (here $f^{(i)}=$ $(\partial / \partial t)^{\mathrm{i}} f$ ).

The norm $\nu_{k}$ defines a Banach space structure in $\mathrm{C}^{k}$.
2. We set $\mathscr{L}=\eta(S)$ and $\mathscr{L}^{k}=\mathscr{L} \cap C^{k}(k=0,1, \ldots)$.

Corollary of Proposition 4.1. $\operatorname{dim}\left(L_{1} / \mathscr{L}^{k}\right)<\infty$.
Definition 4.3. 1. We put $\mathrm{C}_{\mathrm{k}}^{\prime}=\left(\mathrm{C}^{\mathrm{k}}\right)^{*}$ and $\mathscr{L}_{k}^{\prime}=\left(\mathscr{L}+C^{k}\right)^{*}(\mathrm{k}=0,1, \ldots) .\left(\mathscr{L}+C^{k}\right.$ we provide with the norm induced by the norm $\nu_{\mathrm{k}}$ on $\mathrm{C}^{\mathrm{k}}$. Since $\left(\mathscr{L}+C^{k}\right) / C^{k}=\mathscr{L} / \mathscr{L}^{k}$ is finite dimensional this can be done uniquely up to equivalence.)
2. We put $C_{\infty}^{\prime}=U C_{k}^{\prime}$ and $\mathscr{L}^{\prime}=\bigcup \mathscr{L}_{k}^{\prime}, \mathrm{k}=0,1, \ldots$ The spaces $C_{\infty}^{\prime}$ and $\mathscr{L}^{\prime}$ we provide with the inductive limit topologies.
3. We denote by $x$ the natural projection $x: \mathscr{L}_{k}^{*} \rightarrow C_{k}^{*}$ and put $\widetilde{\mathscr{L}}_{k}=\operatorname{Ker} x\left(=\left(\mathscr{L} / \mathscr{L}^{k}\right)^{*}\right)$ and $\widetilde{\mathscr{L}}=\bigcup \widetilde{\mathscr{L}}_{k}$, $k=0,1, \ldots$

Remark 1. The spaces $\widetilde{\mathscr{L}}_{k}$ are finite dimensional.
Remark 2. The space $C_{\infty}^{\prime}$ is a space of generalized functions on $\Omega$ which do not grow rapidly near the boundary.

LEMMA 4.2. 1. The sequence $0 \rightarrow \widetilde{\mathscr{L}} \rightarrow \mathscr{L} \xrightarrow{\overleftrightarrow{\sim}} C_{\infty}^{\prime} \rightarrow 0$ is exact.
2. Each element $u \in \mathscr{L}$ is defined by its values on $\mathscr{L}$.

Proof. Assertion 1 follows from the definitions. We prove assertion 2. From the definition of $\eta$ it follows easily that $\mathscr{L} \supset C_{c}^{\infty}(\Omega)$; therefore, $\mathscr{E}$ is dense in any of the spaces $\mathscr{L}+C^{\mathscr{E}}$. Therefore, any element $u \in \mathscr{E} \mathscr{E}_{k}^{\prime}$ is defined by its values on $\mathscr{L}$.

Definition 4.4. 1. We denote by $\eta^{*}: \mathscr{L}^{\prime} \rightarrow S^{\prime}$ the mapping which is the transpose of the mapping $\eta: S \rightarrow \mathscr{L}$. (It is easy to verify that it is defined and continuous.)
2. If $f \in \mathrm{C}_{\infty}^{\prime}$, then we put $f(\mathrm{P})=\boldsymbol{\eta}^{*}\left(\mathcal{x}^{-1}(f)\right) \in \mathrm{S}^{\prime}$, where $\chi^{-1}(f)$ is any pre-image of $f$.

We note that the function $f(P) \in S^{\prime}$ is not defined uniquely, but rather only up to elements of $\eta^{*}$ ( $\widetilde{\mathscr{L}}$ ). If $f \in C_{k}^{\prime}$, then this nonuniqueness can be reduced by choosing $x^{-1}(f) \in \mathscr{L}_{k}^{\prime}$. Thus, $f(\mathrm{P})$ is defined up to elements of the finite dimensional space $\eta^{*}\left(\widetilde{\mathscr{L}}_{k}\right)$.

If the function $f$ is continuous on $\bar{\Omega}$, then it is possible to choose for $f(\mathrm{P}) \in \mathrm{S}^{\prime}$ the following regular function on $V_{\mathbf{R}}: f[\mathrm{P}]=(0$ for $\mathrm{x} \notin \Theta, f(\mathrm{P}(\mathrm{x}))$ for $\mathrm{x} \in \Theta)$.

We now proceed to study the differential equations which the functions $f(\mathrm{P})$ satisfy.
THEOREM 4.3. If $f \in C_{\infty}^{\prime}$ and satisfies a nontrivial equation $\mathscr{N}(f)=0$, where $\mathscr{D} \in D_{T}$, then the function $f(\mathrm{~F})$ lies in $\mathrm{S}_{0}^{\prime}$.

Example. The function $e^{\mathrm{iP}} \in \mathrm{S}_{0}^{\prime}$. In particular, its Fourier transform is analytic everywhere except for a certain semialgebraic set.

Theorem 4.3 follows easily from the following two theorems, the proofs of which form the content of § §5, 6 .

THEOREM 4.3. Let $f \in C_{\infty}^{\prime}$ and $\mathscr{D} f=0$, where $\mathscr{X} \in D_{T}, \mathscr{F} \neq 0$. We denote by $\overline{f(\mathbf{P})}$ the image of the function $f(\mathrm{P})$ in the D -module $S^{\prime} / D\left(\eta^{*}(\widetilde{\mathscr{L}})\right)$. Then $\left.\operatorname{dim} \Delta(\mathrm{D}(\overline{f(\mathrm{P}}))\right) \leq \mathrm{N}$.

THEOREM 4.3". If $u \in \mathscr{\mathscr { L }}$, then $\left.\eta^{*}(\mathrm{u}) \in \mathrm{S}_{0}^{\prime}\right)$.
85. Froof of Theorem 4.3'.

PROFOSITION 5.1. Let $f \in C_{\infty}^{\prime}$. Then

$$
\begin{equation*}
\left[\frac{\partial}{\partial x_{i}}(f(P))-P_{i}\left(\frac{\partial f}{\partial t}(P)\right)\right] \in D\left(\eta^{*}(\widetilde{\mathscr{L}})\right) . \tag{*}
\end{equation*}
$$

Proof. We note that the assertion (*) does not depend on the choice of the functions $f(P)$ and $(\theta f / \partial t)$ (P). Let $f \in \mathrm{C}_{\mathrm{k}}^{\prime}$. It is clear that the assertion is local in t , and it may therefore be assumed that $f$ is concentrated in a neighborhood of the point $\mathrm{t}_{0}=0$.

Let $\lambda \in C$ and $\operatorname{Re} \lambda \geq 0$. We set $f \lambda=f \cdot|t| \lambda \in C_{k}^{\prime}$. This is an analytic function of $\lambda$. When Re $\lambda$ is large, we define analytic functions of $\lambda, u f$, and $v f$ with values in $\mathscr{L}_{k+1}^{\prime}$ by the formulas $u f(\psi)=f(|t| \lambda \psi)$ and $\mathrm{v} f^{(\psi)}=-f\left(|t|^{\lambda}(\partial / \partial \mathrm{t}) \psi\right)$, where $\psi \in \mathscr{L}$. It is clear that $x\left(\mathrm{u} f(\epsilon)=f_{\lambda}\right.$ and $x(\mathrm{vf}(\lambda))=(\partial / \partial t) f_{\lambda}$. We will prove that $\left(\partial / \partial x_{i}\right) \eta^{*}\left(u_{f}\right)=P_{i} \cdot \eta^{*}(v f)$ 。

Indeed, let $f_{\mathrm{n}}$ be a sequence of functions in $\mathrm{C}^{1}$ which converges to $f$ in $C_{k}^{\prime}$. Then for each $\lambda u_{\mathrm{n}} \rightarrow \mathrm{u}_{f}$ and $v f_{n} \rightarrow v f$ in the space $\mathscr{T}_{k+1}^{\prime}$. It is therefore sufficient to show that $\left(\partial / \partial x_{i}\right) \eta^{*}\left(u f_{\mathrm{n}}\right)=P_{\mathrm{i}} \cdot \eta *\left(\mathrm{v} f_{\mathrm{n}}\right)$. But in this case

$$
\eta^{*}\left(u_{i_{n}}\right)(\lambda)=f_{n \lambda}|P| \quad \eta^{*}\left(v_{i_{n}}\right)(\lambda):=\left(\frac{\partial}{\partial t} f_{n \lambda}\right)[P],
$$

where $f_{\mathrm{n} \lambda}=f_{\mathrm{n}} \cdot|\mathrm{t}| \lambda \in \mathrm{C}^{1}$. Therefore, the equation $(\partial / \partial \mathrm{xi}) \eta^{*}\left(\mathrm{u} f_{\mathrm{n}}\right)=\mathrm{P}_{\mathrm{i}} \eta^{*}\left(\mathrm{v} f_{\mathrm{n}}\right)$ is simply the formula for the derivative of a composite function.

We have thus shown that $\left(\partial / \partial \mathrm{xi}_{\mathrm{i}}\right) \eta_{*}\left(\mathrm{u}_{f}\right)=\mathrm{P}_{\mathrm{i}} \eta_{*}(\mathrm{v} f)$.

Since the kernel $\widetilde{\mathscr{L}}_{k+1}$ of the mapping $\quad x: \mathscr{L}_{k+1}^{\prime} \rightarrow C_{k+1}^{\prime}$ is finite-dimensional, it is possible to find functions $u\left(\lambda\right.$ and $v(\lambda)$ with values in $\mathscr{L}_{k+1}$, defined for $\operatorname{Re} \lambda \geq 0$, such that $x(u(\lambda))=f_{\lambda}$ and $\left.x(v)(\lambda)\right)=$ $\left(\partial f_{\lambda} / \partial t\right)$. When Re $\lambda$ is large, it follows that $u(\lambda)-u_{f}(\lambda) \in \widetilde{\mathscr{L}}_{k+1}$ and $v(\lambda)-v_{f}(\lambda) \in \widetilde{\mathscr{L}}_{k i-1}$; therefore,

$$
\left[\frac{\partial}{\partial x_{i}} \eta^{*}(u(\lambda))-P_{i} \eta^{*}(v(\lambda))\right] \in \frac{\partial}{\partial x_{i}}\left(\eta^{*}\left(\tilde{\mathscr{L}}_{k+1}\right)\right)+P_{i}\left(\eta^{*}\left(\widetilde{\mathscr{L}}_{k+-1}\right)\right) .
$$

Since the space on the right is finite-dimensional, and the left side depends analytically on $\lambda$, this inclusion is true also for $\lambda=0$, which completes the proof of Proposition 5.1.

Proposition 5.1 enables us to formulate Theorem 4.3' in purely algebraic terms.
Definition 5.1. 1. Let $M$ be a $\mathrm{D}_{\mathrm{T}}$-module. We construct a D -module $\mathrm{Mp}_{\mathrm{p}}$ as follows. As an R module, $\mathrm{Mp}_{\mathrm{p}}$ is equal to $R \underset{R_{T}}{\otimes} M$ ( R is considered as an $\mathrm{R}_{\mathrm{T}}$ algebra relative to the imbedding $\rho: \mathrm{R}_{\mathrm{T}} \rightarrow \mathrm{R}$, $\rho(t)=P)$. The action of the operators $\left(\partial / \partial x_{i}\right)$ is given by the formulas $\frac{\partial}{\partial x_{i}}(r \otimes e)=\frac{\partial r}{\partial x_{i}}\left(\geqslant e+P_{i} r \otimes \frac{\partial}{\partial t} e\right.$, where $r \in R, e \in M$.
2. If $f \in M$, then we put $f_{\mathrm{P}}=1 \otimes f \in \operatorname{MP}, \mathrm{MP}_{\mathrm{P}}(f)=\mathrm{D}\left(f_{\mathrm{P}}\right), \operatorname{IP}(f)=\operatorname{Ann}\left(f_{\mathrm{P}}\right) \in \mathrm{D}$.

It is easy to verify that Definition 5.1 is good. The mapping $M \rightarrow M p$ gives a functor from the category of $\mathrm{D}_{\mathrm{T}}$-modules to the category of D -modules.

We note that even if $M$ is finitely generated, the module $M_{p}$ may not be finitely generated.
It follows from Proposition 5.1 that it is possible to construct a mapping of $D$-modules $\eta^{0}:\left(\mathrm{C}_{\infty}^{\prime}\right)_{\mathrm{P}} \rightarrow$ $\mathrm{S}^{\prime} / \mathrm{D}\left(\eta^{*}(\widetilde{\mathscr{L}})\right)$ such that $\eta^{0}(1 \otimes f)=f(\mathrm{P}) \bmod \mathrm{D}\left(\eta^{*}(\widetilde{\mathscr{L}})\right)$ for any $f \in \mathrm{C}_{\infty}^{\prime}$. Therefore, Theorem 4.3' follows from the following purely algebraic theorem.

THEOREM 5.2. Let $M$ be a $\mathrm{D}_{\mathrm{T}}$-module, $f \in \mathrm{M}$. If $\operatorname{dim} \Delta(\mathrm{M}) \leq 1$, then $\operatorname{dim} \Delta(M P(f)) \leq N$.
Proof. 1. We first consider the case in which the principal part of the polynomial $P$, which we denote by $\widetilde{P}$, is nondegenerate, i.e., sing $\widetilde{P}=\{0\}$. In this case the set sing $P$ is compact and hence finite.

Our aim is to construct sufficiently many elements in the ideal $\operatorname{IP}(f)$. We note first of all that for any i and j the operators $\mathscr{H}_{i j} \ldots P^{i} \frac{\partial}{\partial x_{j}}-P_{\mathrm{J}} \frac{\partial}{\partial x_{i}} \in D$ belong to $\operatorname{IP}(f)$.

Let $\mathscr{D}_{0}(f)=0$, where $\mathscr{F}_{0} \in D_{T}$. We write $\mathscr{F}_{0}$ in the form $\mathscr{L}_{0}=Q(t)\left(\frac{\partial}{d t}\right)^{k} \cdot \mathscr{L}^{\prime}$, where $\mathscr{D}^{\prime} \in D_{T}^{k-1}$.
LEMMA 5.3. Let $s=k(k-1) / 2$. Then for any indices $i, j(1 \leq i, j \leq N)$ there exists an operator $\mathscr{D}_{i j} \in I_{P}(f)$, such that $\sigma\left(\mathscr{D}_{i j}\right)=Q(P) P_{i, y_{i}}^{k}$.

Proof. If e $\in M, r \in R, \beta=\left(j_{1}, \ldots, j N\right)$, then

$$
\left(\frac{\partial}{\partial x}\right)^{\beta}(r \otimes e)=r \cdot P^{\beta} \otimes\left(\frac{\partial}{\partial t}\right)^{|\beta|} e+e^{\prime}, \text { where } P^{\beta}=P_{1}^{j_{1}} \ldots \ldots P_{N}^{j_{N}} \text { и } e^{\prime} \in R \otimes D_{T}^{\mid(\mid-1-1}(e) .
$$

From this it follows easily that $\mathrm{P}_{\mathrm{i}}^{\mathrm{S}} \otimes \mathrm{D}_{\mathrm{T}}^{\mathrm{k}-1}(f) \subset \mathrm{D}^{\mathrm{k}-1}(1 \otimes f)$.
Since $\mathscr{D}_{0}(f)=\left(Q(t)\left(\frac{\partial}{\partial t}\right)^{k}+\mathscr{D}^{\prime}\right) f=0$, it follows that $Q(t)\left(\frac{\partial}{\partial t}\right)^{k} f \in D_{T}^{k-1}(f)$. Therefore, $Q(P)\left(\partial / \partial \mathrm{x}_{\mathrm{j}}\right) \mathrm{k}$ $(1 \otimes f) \in R \otimes D_{T}^{\mathrm{k}-1}(f)$, and hence $\mathrm{Q}(\mathrm{P}) \cdot \mathrm{P}_{\mathrm{i}}^{\mathrm{S}}\left(\partial / \partial \mathrm{x}_{\mathrm{j}}\right)^{\mathrm{k}}(1 \otimes f)=\mathscr{D}(1 \otimes f)$, where deg $\tilde{D} \leqslant k-1$. It is thus possible to set $\mathscr{D}_{i j}=Q(P) \times P_{i}^{s}\left(\frac{\partial}{\partial x_{j}}\right)^{k}-\widetilde{\mathscr{D}}$.

Thus, in $\sigma(\mathbf{I} \mathbf{P}(f))$ there are elements $\sigma\left(\mathscr{H}_{i j}\right)=P_{i} y_{j}-P_{j} y_{i}$ and $\sigma\left(\mathrm{D}_{\mathrm{ij}}\right)=\mathrm{P}_{\mathrm{i}}^{\mathrm{s}} \cdot \mathrm{Q}(\mathrm{P}) \cdot \mathrm{y}_{\mathbf{j}}^{\mathrm{k}}$.
Therefore, $\Delta\left(\mathrm{MP}_{\mathrm{P}}(f)\right)$ is contained in the union of the following sets: sing $\mathrm{P} \times \mathrm{V}^{*}$ and

$$
A_{i}=\left\{(x, y) \in V \times V^{*} \mid P_{i}(x) \neq 0, Q(P)(x)=0, y_{j}=y_{i} \cdot P_{i}(x) / P_{i}(x)\right\}
$$

All these sets have dimension no greater than $N$; therefore $\operatorname{dim} \Delta(M P(f)) \leq N$.
2. We will now prove Theorem 5.2 for an arbitrary polynomial $P \in R$. We wish to show that $d_{1}^{n}\left(\mathscr{F} / I_{P}(f)\right)=O\left(n^{N}\right) \quad$ (see Theorem 3.1). For the case in which $\widetilde{\mathrm{P}}$ is nondegenerate, we have already proved this.

We denote the degree of the polynomial by $q(q>0)$ and consider a family of polynomials of degree $q$ depending on the parameter $\tau \in C$,

$$
P_{\tau}=P \cdot(1-\tau) \therefore\left(x_{1}^{q}+\ldots+x_{v}^{q}\right) \tau .
$$

Since the set of polynomials of degree $q$ with nondegenerate principal part is open in the Zariski topology and $P_{1}$ is contained in this set, it follows for all $\tau \in C$, except for a finite number, that the polynomial $\widetilde{P}_{\tau}$ is nondegenerate.

LEMMA 5.4. For any natural number $n$ the inequality $\operatorname{dim} \operatorname{IP}_{T}(f)_{1}^{n} \leq \operatorname{dim} \operatorname{Ip}(f)_{1}^{n}$ is satisfied for all $\tau \in C$, except a countable number.

Proof. This follows from the fact that the space $\operatorname{IP}_{\tau}(f)_{1}^{n}$ is singled out in $D_{1}^{n}$ by linear equations whose coefficients are rational functions of $\tau$. We described this in more detail. We set $B=R Q M$ and define mappings $\mu_{\tau}^{\mathrm{n}}: \mathrm{D}_{1}^{\mathrm{n}} \rightarrow \mathrm{B}$ and $\boldsymbol{\nu}_{\tau}: \mathrm{B} \rightarrow \mathrm{B}:$

$$
\mu_{\tau}^{n}\left(x^{a} \frac{\partial}{\partial x_{i_{1}}} \cdot \ldots \cdot \frac{\partial}{\partial x_{i_{k}}}\right)=x^{a} \frac{\partial}{\partial x_{i_{1}}}\left(\cdots\left(\frac{\partial}{\partial x_{i_{k}}}(1 \otimes f)\right)\right)
$$

where $\left(\partial / \partial \mathrm{x}_{\mathrm{i}}\right)(\mathrm{r} \otimes \mathrm{e})=\left(\partial \mathrm{r} / \partial \mathrm{x}_{\mathrm{i}}\right) \otimes \mathrm{e}+\mathrm{r}\left(\mathrm{P}_{\tau}\right)_{\mathrm{i}} \otimes(\partial / \partial t) \mathrm{e}$ (we assume that each element $T \mathrm{f} D$ is written in the form $\mathscr{D}=\Sigma c_{u_{3}, 3}(\mathscr{C}) x^{a}\left(\frac{\partial}{\partial x}\right)^{\beta}$;

$$
r_{r}(r \otimes e)-\operatorname{Pr} \otimes e-r \otimes t e
$$

It is easy to verify that $\nu_{0}$ is an imbedding.
We deduce Lemma 5.4 from the fact that $I P_{\tau}(f)_{1}^{n}=\left(\mu_{\tau}^{\mathrm{n}}\right)^{-1} \nu_{\tau}(\mathrm{B})$. We set $\mathrm{B}_{\mathrm{k}}=\mathrm{D}_{1}^{\mathrm{k}}(1) \otimes \mathrm{D}_{\mathrm{T}_{1}}^{\mathrm{k}}(f)$. Then $\nu_{\tau}\left(\mathrm{B}_{\mathrm{k}}\right) \subset \mathrm{B}_{2 \mathrm{k}}$ and $\mu_{\tau}^{\mathrm{n}}\left(\mathrm{D}_{1}^{\mathrm{n}}\right) \subset \mathrm{B}_{\mathrm{k}}$ for large k , and $\operatorname{dim} \mathrm{IP}_{\tau}(f)_{1}^{\mathrm{n}}=\lim _{k \rightarrow \infty} \operatorname{din}\left(\mu_{\tau}^{\prime \prime}\right)^{-1} \cdot \nu_{\tau}\left(\mathrm{Bk}_{\mathrm{K}}\right)$ 。

Therefore, Lemma 5.4 follows from the following assertion, the proof of which we omit: if $\mu \tau$ : $\widetilde{\mathrm{C}} \rightarrow \widetilde{\mathrm{B}}$ and $\nu_{\tau}: \widetilde{\mathrm{A}} \rightarrow \widetilde{\mathrm{B}}$ are linear mappings of finite-dimensional spaces involving $\tau$ as a polynomial and $\nu_{0}$ is an imbedding, then $\operatorname{dim} \mu_{\tau}^{-1} \nu_{\tau}(\widetilde{\mathrm{A}}) \leq \operatorname{dim} \mu_{0}^{-1} \nu_{0}(\widetilde{\mathrm{~A}})$ for all $\tau$ except a finite number.

Lemma $5.4 \underset{\sim}{\operatorname{imp}}$ lies the existence of a point $\tau \in C$, such that $\operatorname{dim} \operatorname{Ip}_{\tau}(f)_{1}^{n} \leq \operatorname{dim} \operatorname{Ip}_{\mathrm{P}}(f)_{1}^{\mathrm{n}}$ for all $n$ and the polynomial $\widetilde{\mathrm{P}}_{\tau}$ is nondegenerate. For this point the following inequalities are satisfied:

$$
d_{1}^{n}\left(D / I_{p}(f)\right) \leqslant d_{1}^{n}\left(D I_{P_{\tau}}(f)\right)=O\left(n^{3}\right) .
$$

Therefore, $\operatorname{dim} \Delta(M P(f)) \leq N$.
This terminates the proof of Theorem 5.2, and hence also Theorem 4.3'.
 sumed without loss of generality that $0 \in \partial \Omega$ and $u \notin \overline{\mathscr{L}}_{+}$, where $\overline{\mathscr{L}}_{F}$ consists of functionals $v \in \mathscr{L}$, for which $v(\varphi)$ is defined by the behavior of the function $\varphi$ in a small right neighborhood of zero $\mathscr{C}$ ). Moreover, we will assume that $P(\partial \Theta)=\{0\}$.

Definition 6.1. Let $\lambda \in \mathrm{C}, \operatorname{Re} \lambda>0$. We denote by $t_{+}^{\lambda}$ the continuous function on $T$ which is equal to 0 for $t<0$ and equal to $t^{\lambda}$ for $t>0$. We consider the function $t_{+}^{\lambda}$ as an element of $\mathscr{L}^{\prime}$.

LEMMA 6.1. 1. The function $t_{+}^{\lambda}$ depends analytically on $\lambda$ for $\operatorname{Re} \lambda>0$ and can be continued as a meromorphic function with values in $\mathscr{L}^{\prime}$ to the entire plane of the variable $\lambda$.
2. We write the expansion of $t_{+}^{\lambda}$ in a Laurent series in a neighborhood of the point $\lambda_{0}$ :

$$
t_{+}^{\lambda}=a_{-k}\left(\lambda_{0}\right)\left(\lambda-\lambda_{0}\right)^{-k} \because \ldots \div a_{0}\left(\lambda_{0}\right) \cdots \ldots
$$

Then the coefficients $a_{-k}\left(\lambda_{0}\right), \ldots, a_{-1}\left(\lambda_{0}\right) \in \widetilde{\mathscr{L}}_{+}$.
3. The coefficients $a_{-i}\left(\lambda_{0}\right)$ for all possible $\mathrm{i}>0$ and $\lambda_{0} \in \mathrm{C}$ form an algebraic basis in $\mathscr{L}_{+}$.

The proof follows immediately from the asymptotic expansion for functions $\varphi \in \mathscr{L}$ obtained in Proposition 4.1 (see [1], Ch. 1, 4).

We will study the equations satisfied by the functions $t_{+}^{\lambda}$. For this we will have to consider equations depending on $\lambda$.

Let $\mathrm{D}[\lambda]$ be the ring of polynomials in the variable $\lambda$ with coefficients in $D$. In it we introduce the filtrations $\left\{\mathrm{D}^{\mathrm{n}}[\lambda]\right\}$ and $\left\{\mathrm{D}^{p}[\lambda]\right\}$. The associated ring with respect to the filtration $\left\{\mathrm{D}^{\mathrm{n}}[\lambda]\right\}$ is isomorphic to $\Sigma[\lambda]$, and the corresponding affine variety is equal to $W \times \Lambda$ ( $\Lambda$ is the complex line).

If $\lambda_{0} \in C$, then by $s \lambda_{0}$ we denote the evaluation mapping $D[\lambda] \rightarrow D$ and $\Sigma[\lambda] \rightarrow \Sigma$, obtained by replacing $\lambda \rightarrow \lambda_{0}$.

LEMMA 6.2. We set $\mathrm{e}_{\mathrm{i}}=\mathrm{ti} \in \mathrm{D}_{\mathrm{T}}(\mathrm{i}=0,1, \ldots), \mathrm{e}_{\mathrm{i}}=(\partial / \partial \mathrm{t})^{-\mathrm{i}} \in \mathrm{D}_{\mathrm{T}}(\mathrm{i}=-1,-2, \ldots)$. Then each element $\mathscr{D} \in D_{T}$ can be uniquely described in the form $\mathscr{D}=\sum_{-\infty}^{\infty} e_{i} \cdot Q_{i}\left(t \frac{\partial}{\partial t}\right)$, where the $Q_{i}$ are polynomials of a single variable.

The proof of the lemma follows immediately by induction on the degree of $\mathscr{f}$.
We consider the $\mathrm{D}_{\mathrm{T}}[\lambda]$-module $\mathrm{M}=\mathrm{D}_{\mathrm{T}}[\lambda] / \mathrm{D}_{\mathrm{T}}[\lambda][\mathrm{t}(\partial / \partial \mathrm{t})-\lambda]$ and denote its generator by $f$. Lemma 6.2 implies that the elements $e_{i}$ form a base for the $C[\lambda]$-module M. In analogy with Definition 5.1 , we construct the $\mathrm{D}[\lambda]$-module $\mathrm{MP}^{( }(f)$ and the ideal $\operatorname{IP}(f)$ in $\mathrm{D}[\lambda]$.

THEOREM 6.3. The set $\Delta(\operatorname{Mp}(f)) \subset W \times \Lambda$ consists entirely of lines of the form $w \times \Lambda, w \in W$.
Proof. We set $M^{\prime}=D_{T}[\lambda] / D_{T}[\lambda](\mathrm{t}(\partial / \partial \mathrm{t})-\lambda-1)$, and let $f$ ' be the generator of $\mathrm{M}^{\prime}$. Since $\mathrm{t}(\partial / \partial \mathrm{t})(\mathrm{t} f)=$ $(\lambda+1) \mathrm{t} f$, it is possible to define a mapping of $\mathrm{D}_{\mathrm{T}}[\lambda]$-modules $\mu: \mathrm{M}^{\prime} \rightarrow \mathrm{M}$, by putting $\mu\left(f^{\prime}\right)=\mathrm{t} f$. It follows from Lemma 6.2 that $\mu$ is an imbedding. The mapping which it induces $\mu_{\mathrm{p}}: \mathrm{M}_{\mathrm{P}}^{\prime}\left(f^{\prime}\right) \rightarrow \mathrm{MP}(f)$ (here $\mu_{\mathrm{P}}$ $\left.\left(1 \otimes f^{\prime}\right)=\mathrm{P} \otimes f\right)$ is also an imbedding. It follows from Lemma 1.5 that $\Delta\left(\operatorname{MP}\left(f^{\prime}\right)\right) \in \Delta(\operatorname{MP}(f))$ 。

The ideal $\operatorname{IP}\left(f^{\prime}\right)$ is obtained from the ideal $\operatorname{IP}(f)$ by replacing $\lambda \rightarrow \lambda+1$, and therefore $\Delta\left(M_{P}^{\prime}\left(f^{\prime}\right)\right)=$ $\mathrm{Z}\left(\sigma\left(\operatorname{IP}\left(f^{\prime}\right)\right)\right)$ is a translation of $\Delta(\operatorname{Mp}(f))$ along the line $\Lambda$ by -1 . If the point $\left(w, \lambda_{0}\right) \in \Delta(\operatorname{Mp}(f))$, then the points $\left(w, \lambda_{0}-1\right), \ldots,\left(w, \lambda_{0}-n\right) \ldots \in \Delta\left(M_{P}(f)\right)$. Since $\Delta\left(M_{P}(f)\right)$ is a closed algebraic variety in $W \times \Lambda$, it follows that $\mathrm{w} \times \Lambda=\Delta(\operatorname{MP}(f))$, which completes the proof of Theorem 6.3.

Definition 6.2. 1. We set $\Delta P=\{W \in W \mid w \times \Lambda \subset \Delta(\operatorname{MP}(f))\}$. 2. For any $\lambda \in C$ we denote by $M \lambda$ the $\mathrm{D}_{\mathrm{T}}$-module $\mathrm{D}_{\mathrm{T}} / \mathrm{D}_{\mathrm{T}}[\mathrm{t}(\partial / \partial \mathrm{t})-\lambda]$ with generator $f \lambda$ and put $\mathrm{I}_{\lambda}=\mathrm{I}_{\mathrm{p}}(f \lambda) \subset \mathrm{D}$. The ideal $\mathrm{Ip}(f) \subset \mathrm{D}[\lambda]$ we denote by I .

It follows from Theorem 6.3 that $\Delta \mathrm{P}=\mathrm{Z}\left(\mathrm{s}_{\lambda_{0}}(\sigma(\mathrm{I}))\right.$ ) for any $\lambda_{0} \in \mathbf{C}$.
PROPOSITION 6.4. $\operatorname{dim} \Delta p \leq N$.
Proof. From Lemma 6.2 it is easy to derive the following Lemma 6.5.
LEMMA 6.5. The $C[\lambda]$-submodule $I_{1}^{n}$ of $D_{1}^{n}[\lambda]$ is given by linear equations with coefficients in $C[\lambda]$. If in these coefficients we make the replacement $\lambda \rightarrow \lambda_{0}$, where $\lambda_{0} \in C$, then they go over into equations for the subspaces $\left(\mathrm{I} \lambda_{0}\right)_{1}^{\mathrm{n}}$ in $\mathrm{D}_{1}^{\mathrm{n}}$.

We choose a point $\lambda_{0} \in C$ which is algebraically independent of all the numerical coefficients which enter in the equations defining the ideal I.

It then follows from Lemma 6.5 that $s_{\lambda_{0}}\left(\mathrm{I}_{1}^{\mathrm{p}}\right)=\mathrm{I}_{\lambda_{0} 1}^{\mathrm{n}}$ for all n . Therefore, $\mathrm{s}_{\lambda_{0}}(\sigma(\mathrm{I}))=\sigma\left(\mathrm{s}_{\lambda_{0}}(\mathrm{I})\right)$, i.e., $\Delta \mathrm{P}=\Delta\left(\left(\mathrm{M}_{\lambda_{0}}\right) \mathrm{P}\left(f \lambda_{0}\right)\right)$, and by Theorem $5.2 \mathrm{dim} \Delta \mathrm{P} \leq \mathrm{N}$.

LEMMA 6.6. If $\mathscr{D} \in I \subset D[\lambda]$, then $\mathscr{D}\left(\eta^{*}\left(t_{+}^{\lambda}\right)\right)=0$ identically in $\lambda$.
Proof. We set $m=\operatorname{deg} \mathscr{D}$. It is easy to verify that for Re $\lambda>m$ the relation $\left(\partial / \partial \mathrm{x}_{\mathrm{i}}\right) \eta^{*}(\mathrm{u})=$ $\mathrm{P}_{\mathrm{i}} \eta^{*}(\partial \mathrm{u} / \partial \mathrm{t})$ is satisfied for all $u \in \mathrm{D}_{\mathrm{T}}^{\mathrm{m}}{ }^{-1}\left(\mathrm{t}_{+}^{\lambda}\right)$. This implies that $\mathscr{D}\left(\eta^{*}\left(t_{+}^{\lambda}\right)\right)=0$ for $\operatorname{Re} \lambda>\mathrm{m}$. The proof of the lemma is complete.

PROPOSITION 6.7. Let $t_{+}^{\lambda}=a_{-k}\left(\lambda-\lambda_{0}\right)-k+\ldots+a_{0}+a_{1}\left(\lambda-\lambda_{0}\right)+\ldots+$ be the expansion of the function $t_{+}^{\lambda^{\lambda}}$ in a Laurent series, $a_{\mathrm{i}} \dot{\mathcal{L}}^{+} \mathscr{L}^{\prime}$. Then $\Delta\left(\mathrm{D}\left(\eta^{*}\left(a_{\mathrm{i}}\right)\right)\right) \subset \Delta_{\mathrm{P}_{\mathrm{n}}}$ for any $\mathrm{i}(\mathrm{i}=-\mathrm{k}, \ldots, 0,1, \ldots)$.

Proof. Let $\mathscr{D}=\mathscr{D}_{0}+\left(\lambda-\lambda_{0}\right) \mathscr{D}_{1}-\ldots+\left(\lambda-\lambda_{0}\right) \mathscr{D}_{n} \in I$. We put $\dddot{C}_{j}=\eta^{*}\left(a_{j}\right)$. Applying Lemma 6.6 , we obtain the system of equations

$$
\mathscr{D}_{0} \mathscr{E}_{-k}=\mathscr{D}_{0} \mathscr{E}-k+1+\mathscr{D}_{1} \mathscr{E}-k=\ldots=\mathscr{D}_{0} \mathscr{C}_{i}+\ldots+\mathscr{I}_{k+i} \mathscr{E}_{-k}=0
$$

We set $M_{i}=D\left(\mathscr{E}_{-k}, \ldots, \mathscr{E}_{i}\right)$. It is evident from these equations that the generator $\bar{c}_{j}$ in the module $M_{j} / M_{j-1}$ satisfies the equation $s_{\lambda_{0}}(D)\left(\bar{\epsilon}_{j}\right)=0$ for any $\mathscr{D} \in I$. This means that $\Delta\left(M_{j} / M_{j-1}\right) \subset Z\left(\sigma\left(\mathrm{~s}_{\lambda_{0}}(\mathrm{I})\right)\right)$ $-\Delta_{\mathbf{P}}$.

Theorem $4.3^{\prime \prime}$ is a direct consequence of Lemma 6.1 and Propositions 6.4 and 6.7.
§7. Fundamental Solutions of Equations with Constant Coefficients
PROPOSITION 7.1. Let $P$ be a polynomial with real coefficients on VR. Then the function $|P|^{\lambda}$, defined for Re $\lambda>0$, can be continued analytically as a meromorphic function with values in $S^{\prime}$ to the entire complex plane of the variable $\lambda$. If $\widetilde{P}^{\prime}$ is any coefficient of the Laurent series for the function $|P|^{\lambda}$ at any point $\lambda$, then $\Delta\left(D\left(\widetilde{P}^{\prime}\right)\right) \subset \Delta P\left(\right.$ in particular, $\operatorname{dim} \Delta\left(D\left(\widetilde{P}^{\prime}\right)\right) \leq N$, i,e., $\left.\widetilde{P}^{\prime} \in S_{0}^{\prime}\right)$.

This proposition follows immediately from Proposition 6.7 and Lemma 6.1.
We will now prove Theorem $C$ of the introduction. We seek a solution of the equation $L\left(-i\left(\partial / \partial x_{k}\right)\right.$ $\left(\mathscr{C}_{L}\right)=\delta$ in the form $\mathscr{E}_{L}=F(\widetilde{\mathscr{C}})$ ( F is Fourier transformation) .

The function $\overline{\mathscr{C}}$ must satisfy the equation $\mathrm{L}\left(\mathrm{x}_{\mathrm{k}}\right) \cdot \tilde{\mathscr{H}}=1$. We put $\mathrm{P}=\mathrm{L} \cdot \overline{\mathrm{L}}$ and take as $\overline{\mathscr{C}}$ the zeroth term of the Laurent series of the function $\overline{\mathrm{L}} \cdot \mathrm{P}^{\lambda}$ at the point $\lambda=-1$. Then $L \cdot \widetilde{e}=1$, and, as follows from Proposition 7.1, $\widetilde{\mathscr{c}} \in S_{0}^{\prime}$. Using Corollary 3.4 , we deduce that the fundamental solution $\mathscr{F}_{L}$ lies in $S_{0}^{\prime}$. This completes the proof of Theorem C.

Hypothesis. $\Delta \mathrm{p} \subset\left\{(\mathrm{x}, \mathrm{y}) \in \mathrm{V} \times \mathrm{V}^{*} \mid(\mathrm{x}, \mathrm{y}) \in \bar{\square}_{\mathrm{P}}, \mathrm{P}(\mathrm{x})\right\}=0$, where $\square \mathrm{p}=\left\{(\mathrm{x}, \mathrm{y}) \in \mathrm{V} \times \mathrm{V}^{*} \mid \mathrm{x} \notin\right.$ sing P, $P_{i} y_{j}=P_{j} y_{i}$ for all $\left.i, j\right\}$.

In the case in which $L$ is a homogeneous polynomial this hypothesis enables us to find a cone containing the singularities of the fundamental solution of the operator $\mathrm{L}\left[-\mathrm{i}\left(\partial / \partial \mathrm{x}_{\mathrm{k}}\right)\right]$. It evidently contains the cone constructed by Hörmander in [5], but it does not always coincide with it.
