

ExquiMo: An Exquisite Corpse Tool for Co-creative 3D Shape Modeling

Abstract

We introduce a shape modeling tool, ExquiMo, which is guided by the idea of improving the *creativity* of 3D shape designs through *collaboration*. Inspired by the game of Exquisite Corpse, our tool allocates distinct parts of a shape to multiple players who model the assigned parts in a sequence. Our approach is motivated by the understanding that *effective surprise* leads to creative outcomes. Hence, to maintain the surprise factor of the output, we conceal the previously modeled parts from the most recent player. Part designs from individual players are fused together to produce an often unexpected, hence creative, end result. However, to maintain the functional plausibility of the final shape, our tool must encourage a certain level of coherence between the parts. We achieve this by first defining an end goal which conveys the targeted shape category, and then revealing a small portion of the connecting regions of any adjacent parts to a player during his/her turn. We demonstrate the effectiveness of collaborative modeling for both man-made and natural shapes. Our results show that, when compared to models designed by single users, multi-user collaborative modeling via ExquiMo tends to lead to more creative designs.

Keywords: Creative Shape Modeling, Collaborative Design

1. Introduction

Creativity is a wonder of the brain. It broadens the human imagination, thereby spawning innovations ranging from surreal paintings to unheard melodies. In computer graphics, where emerging developments in 3D fabrication technologies are changing the face of shape design, creative modeling is beginning to play an important role. Most of the prevalent creative modeling tasks are driven by computational tools [1] operated by humans; hence giving rise to an intriguing question [2]: “Apart from playing the role of a mere tool, can machines assist or *inspire* humans in a creative endeavor for the generation of geometric forms?”

Although this question has not been extensively studied in previous works, inspired modeling methods such as explorative modeling [3], example-driven synthesis [4], and evolutionary design [5] have attempted to develop computational tools to assist human creativity. However, the creativity level of the output produced by these inspired-modeling approaches is limited. To understand the reason that limits the creativity of such tools, it is important to define what creativity is. Jerome Bruner [6] terms effective surprise as the hallmark of a creative enterprise. Often times, the output produced by the inspired modeling methods resembles the models taken as inspirations; hence limiting the effective surprise.

In this paper, we introduce the use of *co-creativity* for 3D shape modeling, with the goal of producing effectively surprising, hence creative, geometric forms. Co-creativity is guided by the collaboration of multiple individuals who contribute to a creative endeavor. During this collaboration, ideas from each individual are fused together to produce unexpected results [7].

Our realization of co-creative modeling is inspired by the tabletop game “Exquisite Corpse” [8], which exploits human collaboration to produce a creative sketch or poem. In an Exquisite

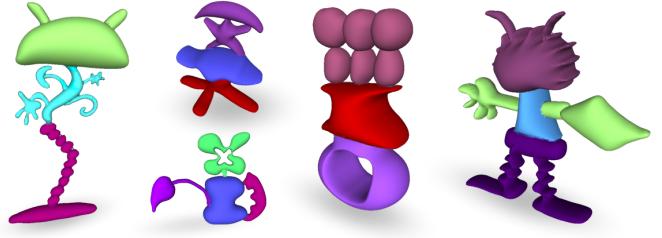

Figure 1: Collaboratively designed 3D shapes via ExquiMo, our modeling tool inspired by the Exquisite Corpse game, exhibiting an appreciable level of creativity. Different colors in each shape correspond to parts designed by different users.

Corpse game, each player draws a particular part of a sketch in sequence, such that previous drawings are concealed from the current player to stimulate unexpectedness of the final outcome. However, a sufficient level of coherence should be maintained between each drawing. Hence, the overall goal is conveyed to all the players at the beginning of the game, e.g., the category of the object drawn, and vague hints of others’ drawings may be revealed to the current player.

In this paper, we introduce *ExquiMo*, an Exquisite Corpse tool for co-creative 3D shape modeling. Given an end goal and the number of players, ExquiMo first allocates one part to each player using a template. A sequential drawing process then allows each player to design his/her part. Here, the user is first asked to sketch the part in 2D, then a sketch-based modeling approach [9] is employed to produce the 3D shape part. At this stage, similar to the game of Exquisite Corpse, all the previous drawings are concealed. However, to further encourage coherency between the parts, hints are provided in the form of small portions of the connecting regions of any adjacent parts, which are revealed to the current player during the turn. Once

⁵⁴ all the parts are drawn in 3D, a part merging step is carried out
⁵⁵ to produce the complete composite 3D shape.

⁵⁶ We demonstrate the creative potential enabled by ExquiMo
⁵⁷ with visual examples of man-made and organic 3D shapes pro-
⁵⁸ duced through collaborative efforts between multiple players.
⁵⁹ It is important to note that none of the players are professional
⁶⁰ artists; they are all graduate students from engineering and com-
⁶¹ puter science departments. Furthermore, we evaluate our ap-
⁶² proach through a user study that is conducted to compare shapes
⁶³ designed by single users to shapes designed collaboratively by
⁶⁴ multiple users. Under both scenarios, the users completed their
⁶⁵ designs using ExquiMo and they were provided with the same
⁶⁶ instructions and goals for the design: to be creative while ensur-
⁶⁷ ing that the produced final object would function as expected.
⁶⁸ For the comparison, a different set of users were asked to judge
⁶⁹ the creativity of the final designs while keeping in mind their
⁷⁰ functionality. Results of the user study are supportive of our hy-
⁷¹ pothesis that multi-user collaborative 3D modeling via ExquiMo
⁷² tends to lead to more creative designs.

⁷³ 2. Related work

⁷⁴ Due to the ubiquity of applications that use 3D graphics,
⁷⁵ effective geometric modeling techniques have gained much at-
⁷⁶ tention over the past few years. Many interactive geometric
⁷⁷ modeling tools have been developed with a motivation of en-
⁷⁸ abling non-expert users to create 3D models efficiently. Part-
⁷⁹ based modeling [10, 11], arguably the predominant modeling
⁸⁰ paradigm, allows a novice user to combine a set of parts taken
⁸¹ from an existing shape repository to produce a new geomet-
⁸² ric form. Recent work by Chaudhuri, et al. [4] adopts the
⁸³ term *creative modeling*; their 3D modeling tool provides data-
⁸⁴ driven suggestions for suitable shape parts to the users so as to
⁸⁵ “stimulate” their creativity. With all the data-driven techniques,
⁸⁶ the conceptual design of the shapes comes from the user [10]
⁸⁷ or is possibly stimulated by machine suggestions [4], yet the
⁸⁸ parts themselves are obtained from existing models, limiting
⁸⁹ the imaginative capabilities of the users. Sketch-based mod-
⁹⁰eling [12] allows the users to freely design shapes and their
⁹¹ parts, but again, any creativity would come purely from the
⁹² users themselves.

⁹³ In our work, we are interested in how human creativity can
⁹⁴ be supported by the underlying modeling tool. Most of the
⁹⁵ existing works on shape modeling do not explicitly target the
⁹⁶ creativity of the synthesized shapes; hence the domain of cre-
⁹⁷ ative modeling is relatively unexplored. One of the few works
⁹⁸ on creative shape modeling comes from evolutionary comput-
⁹⁹ ing [13, 5]. However, to the best of our knowledge, none of the
¹⁰⁰ previous works exploit co-creativity to model creative and func-
¹⁰¹ tionally plausible shapes. In this section, we discuss the most
¹⁰² closely related work to ours in the context of creative shape
¹⁰³ modeling and synthesis.

¹⁰⁴

¹⁰⁵ **Shape synthesis.** When building large repositories of 3D mod-
¹⁰⁶ els, it is helpful to use data-driven approaches, such as proba-
¹⁰⁷ bilistic models [14, 15] or template-based learning approaches

¹⁰⁸ [16] to synthesize novel shapes. Novelty here refers to produc-
¹⁰⁹ ing shapes that are, up to some extent, different from the query
¹¹⁰ shapes topologically or geometrically. Nevertheless, it does not
¹¹¹ directly target “creativity”, which is the focus on our pursuit.

¹¹²

¹¹³ **Shape blending.** Another possible approach to creating novel
¹¹⁴ shapes from a given set of geometrically and topologically vary-
¹¹⁵ ing query shapes is via blending [17, 18]. The blending could
¹¹⁶ be controlled by a user [18], or the user can select the desired
¹¹⁷ shapes from the resulting set [17]. A more recent work [19] in-
¹¹⁸ troduces a low-dimensional procedural model for an object cat-
¹¹⁹ egory to facilitate exploring the space of novel shapes by vary-
¹²⁰ ing different parameters. More relevant to our work is the recent
¹²¹ attempt to automatically design zoomorphic shapes through de-
¹²² forming and merging a man-made object and an animal model
¹²³ to suggest unusual, yet viable, designs to the user [20]. The
¹²⁴ above methods focus on utilizing existing shapes, whereas our
¹²⁵ focus is placed on creative modeling through collaboration.

¹²⁶

¹²⁷ **Evolutionary design.** Early works by Karl Sims [13] apply
¹²⁸ evolutionary computing to produce novel virtual creatures with
¹²⁹ some desired functionality. Several follow-up works [21, 5] in
¹³⁰ computer graphics have applied similar concepts to synthesize
¹³¹ a set of “fit and diverse” shapes. Here, the focus on “diversity”
¹³² attempts to stimulate creativity. In our work, we achieve cre-
¹³³ ativity in shape modeling by combining the ideas of multiple
¹³⁴ users. The fitness or the functional plausibility is achieved by
¹³⁵ defining an end goal that encourages a coherent end result.

¹³⁶

¹³⁷ **Collaborative design.** To the best of our knowledge, our work
¹³⁸ is the first to introduce collaboration into the geometric model-
¹³⁹ ing domain. However, the idea of collaboration is unintention-
¹⁴⁰ ally used by some previous work through crowd-sourcing meth-
¹⁴¹ ods. PicBreeder [22], and EndlessForms [21], are two applica-
¹⁴² tions that provide multiple users to collaborate (or contribute)
¹⁴³ in generating novel images and 3D shapes by evolving a set of
¹⁴⁴ shapes produced by other users. In the work of Talton, et al.
¹⁴⁵ [23], the modeling activity of individual users can be learned as
¹⁴⁶ a distribution to construct high-quality alternative 3D models
¹⁴⁷ through exploring in a space of various models [23]. Although
¹⁴⁸ these systems offer collaborative environments, the users can
¹⁴⁹ only interact with already generated shapes. Conversely, we
¹⁵⁰ concentrate on providing the participants with more control on
¹⁵¹ what they desire to create.

¹⁵²

¹⁵³ In the domain of human computer interaction, a number of
¹⁵⁴ methods have been developed to incorporate a machine as a
¹⁵⁵ colleague for collaborative design. Davis et al. [7] introduce
¹⁵⁶ Drawing Apprentice, a co-creative agent which co-operates with
¹⁵⁷ users in real-time on abstract drawings. We apply a similar con-
¹⁵⁸ cept into the geometric modeling domain. In contrast to their
¹⁵⁹ tool, the collaboration is performed between multiple human
¹⁶⁰ users in our approach and involving a computer partner in the
framework is left for future work.

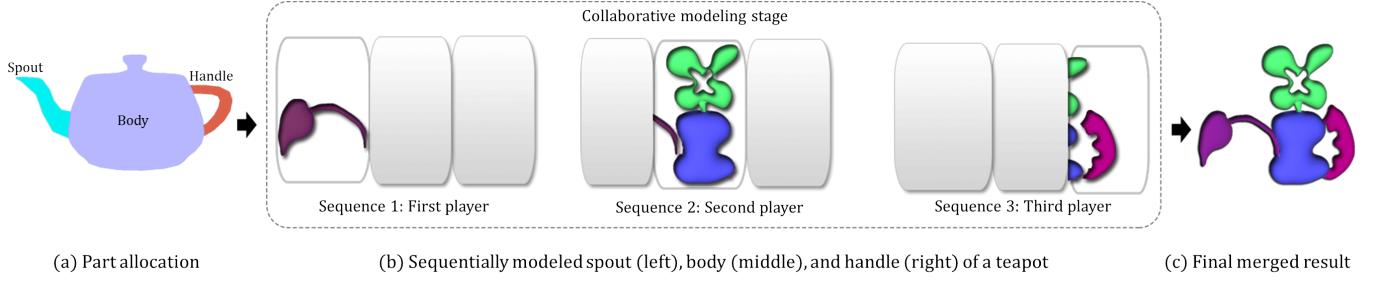

Figure 2: Design pipeline of ExquiMo. Initially, an object category is given and the parts are allocated to players (a). Sequentially, each player designs the allocated part in the form of a 2D sketch, which is then converted to a 3D part (b). Note that a player may receive a small hint for the previously designed part. Finally, the parts are translated, scaled, and merged to produce the final shape (c).

Figure 3: Three interesting sketches produced by the 2D Exquisite Corpse drawing game.

161 3. Shape modeling via Exquisite Corpse

162 Our work is motivated by the idea that collaboration en-
163 hances, or contributes to, the creativity of one person. Col-
164 laboration as a factor of increasing creativity has been studied
165 frequently in both sociology and design domains [24, 25]. As
166 stated by Uzzi and Spiro [24], when multiple individuals con-
167 tribute to some task, “diverse ideas are united together”, giving
168 rise to creative end results. We build upon the game of Exquisite
169 Corpse to collaboratively model a 3D shape while ensuring that
170 the end result is creative and functionally coherent.

171 3.1. The Exquisite Corpse game

172 “Exquisite Corpse” is a multi-player game that showcases
173 collective creativity by producing an extremely creative end re-
174 sult, let it be a poem, a drawing (see Figure 3), or a prose. In the
175 poetic domain, the game proceeds as follows. First, an image
176 of a scenario is shown to all the participants. The first player
177 writes the first verse about the scenery in a piece of paper, and
178 passes it on to the next player in line. All the players can only
179 view the last word of the verse written by their predecessors,
180 which ensures unexpectedness of each input. The lines of the
181 poem are written in a sequence so that, once all the players have
182 contributed, the end result would be a complete poem. The cre-
183 ativity of each person, and the fact that they are unaware of the
184 input of the other players, contribute to the humorous juxtapo-
185 sitions, hence creative end results.

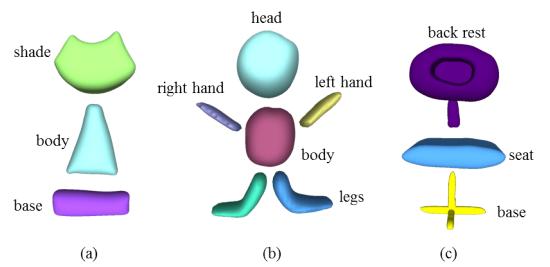

Figure 4: Examples of predefined shape templates, (a) a lamp, (b) a creature, and (c) a swivel chair.

186 3.2. Collaborative modeling paradigm

187 We follow a similar technique to Exquisite Corpse when
188 modeling a 3D shape in parts as a collaboration between two or
189 more players.

190 **191 End goal definition.** Analogous to showing an image contain-
192 ing a scenario in Exquisite Corpse, we first define an end goal to
193 encourage a certain level of coherence between the users. The
194 goal can be the exact type of a chair (e.g., a swivel chair), a
195 shape category (e.g., an animal), or an abstract shape (e.g., an
196 upright shape with 3 parts). The number of players required
197 to draw one shape is predefined and varies according to each
198 shape category.

199 **200 Part allocation.** For each shape category, we predefine a tem-
201 plate that provides a placeholder for each member from the set
202 of semantic components that compose a given shape. An ex-
203 ample of a template is given in Figure 4(a), where the lamp is
204 decomposed into three semantic parts - the shade, body, and
205 base. When a target has been selected, we retrieve its template
206 and players are each allocated one part therefrom; each player
207 will then use the modeling tool to produce their assigned part,
208 taking turns according to a defined sequence (see Figure 2).

209 **210 The modeling tool.** Once each user is allocated a part, the game
211 is started by the player who is allocated the first part. Each
212 player draws a contour, or a less detailed sketch, of the allo-
213 cated part during their turn, which is immediately converted to
214 3D prior to switching players. Since our goal is to encourage
215 creativity while providing a simple tool that even novice play-

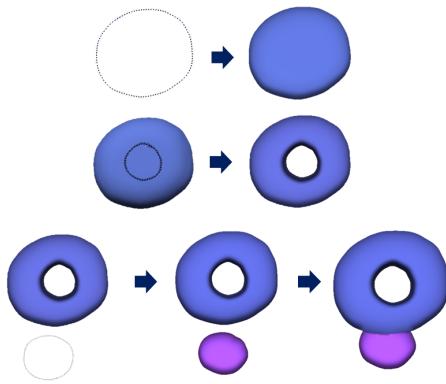

Figure 5: Three examples of the editing operators provided by ShapeShop that allows the players to model creative shapes. The operations are, from top to bottom in order, sketch to 3D conversion, CSG-based cutting, and part merging.

ers can use, we use ShapeShop [9] as the foundation for our modeling tool, and make modifications in order for it to fit to our collaborative modeling workflow (as described under the subsequent steps). ShapeShop provides a sketch-based, 2D interface that then applies CSG-based cutting and blending operations to produce interesting 3D shapes with arbitrary topology, hence aligning with our stated goal of creative modeling. Few of the operations provided by ShapeShop, which were utilized by our modeling tool, are shown in Figure 5.

Co-creative modeling. When the first player draws the allocated part in 3D, our collaborative modeling tool provides an option to “change the user”, which conceals the currently drawn parts from the next player (Figure 2(b)). This technique of hiding the current design from the players contributes to the surprising factor of the output shape. However, parts drawn by different users may not align properly, resulting in implausible or non-functional shapes. Therefore, to encourage coherency, hints are provided in the form of small portions of the connecting regions of the adjacent parts, which are revealed to the user when necessary. With increasing coherency, the output shape may become less creative. To avoid this drawback, we restricted the user from revealing more than 30% of the adjacent part.

Part merging. At the very end of the game, once all the players complete their turn in designing the corresponding parts, the entire shape is unveiled, and a merge operation is performed by the last player to fusion the parts together. This merge operation consists of two key steps: (i) proper *alignment* of the two parts to be merged, and (ii) *blending* the aligned parts into one complete shape [26]. During the alignment step, our tool simply aligns the reflection symmetry planes of the two parts. The 3D parts which were created from the scratch almost always have the reflectional symmetry property; hence alignment by symmetry planes between two adjoining parts is natural and ubiquitous. If the user deems that a further alignment is necessary, the system then allows the user to manually perform the alignment by means of simple translation and rotation operations. When the parts are properly aligned, our tool utilizes the blending op-

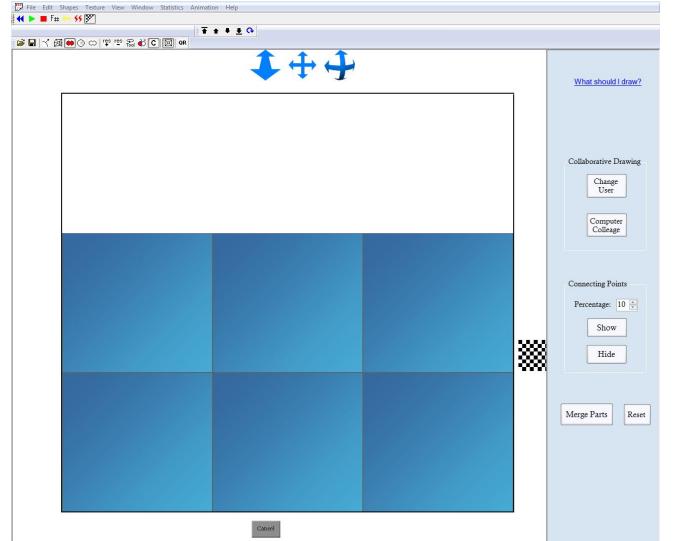

Figure 6: The user interface of our collaborative modeling tool.

erations facilitated by ShapeShop, which implements parameterized Hyperblend [9] via a hierarchical BlobTree structure [27] to combine multiple parts into one shape.

The problem of part merging has been previously studied in the shape composition literature, such as the commonly used field based approaches [28, 26], part snapping [29] based on Soft-ICP registration [30], and boundary interpolation [31], those of which could be feasibly adapted by our work. However, owing to our focus on high-level creative modeling, as opposed to low-level part composition, we chose to implement a much simpler scheme as described.

4. Results and evaluation

In this section, we present results obtained by co-creatively modeling 3D shapes using ExquiMo. Studies were conducted in two stages. In the first stage, we conducted experiments using a set of participants who utilized the tool for collaborative shape modeling. In the second stage, we conducted a user study to evaluate the designs produced in the first stage. All the resulting models collected from the experiments and a video demonstrating the usage of our tool are included in the supplementary material.

Object categories. In the current work, as a proof of concept, we limit ourselves to six object categories: teapots, lamps, vases, swivel chairs and watering cans as man-made shapes, and creatures as an organic shape category. Note that creatures are the most frequently played forms in conventional Exquisite Corpse drawing games. For these target shape categories, we predefined a template consisting of three to five parts. The players are provided with the list of target categories to model, from which they make their selection.

Collaborative modeling. During the first stage of our study, we conducted experiments with 10 participants, who were asked to

Table 1: Statistics from the first questionnaire, which provide the percentage of votes received with respect to the level of collaboration. The three aspects considered for each shape pair were, creativity, functionality, and both creativity and functionality together.

Aspect	Single-user	Collaborative
Creativity	28.57%	71.43%
Functionality	64.89%	35.11%
Creative while functioning (C & F)	46.28%	53.72%

play the game of Exquisite Corpse in 3D using our collaborative modeling tool ExquiMo. The participants are graduate students in computer science and engineering who had a negligible level of experience in design (i.e., novice users). We now discuss the process we followed when conducting the experiments.

First, all the participants were conveyed the purpose of the tool, and the rules of the game (as mentioned in Section 3). They were asked to be “as creative as possible” when drawing the shape parts. Second, the participants were asked to choose one of the predefined target shape categories. A sketch (i.e. an outline) of an abstract shape belonging to the same shape category, with already labeled parts, is shown to all the players to avoid any confusion; see Figure 2(a). As the third step, each user was asked to *individually* model a shape from the selected category using the modeling tool, which was later utilized as the “single-user” design in our second stage. Finally, the players were asked to *collaboratively* model a shape for the selected category using our tool (see Figure 6). When merged, the resulting shape displayed a significant level of creativity as shown in Figure 1 and Figure 7.

Platform and timing. Our tool can be controlled by touch-enabled devices, providing easy interaction to novice users. However, in a situation where a significant level of unease was detected with the tool, the participant was asked to sketch their idea on paper prior to drawing on the computer screen, so that the imaginative capabilities of the user would not have been hindered by the unfamiliarity with the tool. During the modeling process, each player took at most 10 minutes to draw the allocated part, leading to a total game time of 35 minutes on average.

User study. We conducted two preliminary user studies with the shapes acquired from the previous experiments to prove the hypothesis that our collaborative modeling tool is effective in improving the creativity of shape designs. Each study contained two types of questions: quantitative and qualitative. Both studies were completed by 39 participants, majority of which again come from a computer science or engineering background, while a minority was from non-technical disciplines.

The first questionnaire consisted of three parts. In each part, the user was presented with a pair of shapes, where one shape was modeled by a single user, and the other was modeled by a collaborative effort. The pairs shown were randomly shuf-

Table 2: Detailed statistics from the first questionnaire indicating the percentage of votes received for individually and collaboratively designed models belonging to each shape category.

Category	Aspect	Single-user	Collaborative
Lamp	Creativity	10.75%	89.25%
	Functionality	57.50%	42.50%
	C & F	39.24%	60.76%
Chair	Creativity	20.93%	79.07%
	Functionality	66.67%	33.33%
	C & F	41.03%	58.97%
Watering Can	Creativity	23.81%	76.19%
	Functionality	53.85%	46.15%
	C & F	27.91%	72.09%
Teapot	Creativity	25.19%	74.81%
	Functionality	76.92%	23.08%
	C & F	45.30%	54.70%
Creature	Creativity	38.17%	61.83%
	Functionality	53.85%	46.15%
	C & F	48.70%	51.30%
Vase	Creativity	44.32%	55.68%
	Functionality	75.64%	24.36%
	C & F	64.10%	35.90%

fled to avoid any biases. In the first part of the questionnaire, the user was asked to select “the design that is more creative”, given the category of the shape. At the same time, to identify the factors that deem an object creative to humans, we asked the user to reason out his/her choice. Terms or keywords were not provided during the questionnaire, so as not to limit an individual’s definition of creativity. The second part required the user to choose “the design that is more functional”, along with qualitative feedback to specify the reason for their choice. The third part focused on both creativity and functionality together, where the user was asked to select “the design that is more creative, while remaining functional”.

The statistics acquired from the first questionnaire (Table 1 and Table 2) show that the collaboratively modeled shape designs were found to be more “creative” by the users when compared to individually modeled shapes, over all the tested object categories. The most common keywords collected from the qualitative feedback can be identified as the factors that humans used to determine the creativity of the given designs. Out of the five keywords extracted from the study, “unexpected”, “less ordinary”, “imaginative”, “attractive”, and “non-symmetrical” align with the idea of effective surprise addressed by our work. Whereas the keywords “complex” and “more detailed” which are extracted from the responses deviate towards the careful

Table 3: Statistics from the second questionnaire, including the percentage of votes received for each shape category with respect to the level of collaboration.

Category	Single-user	Collaborative
Creature	28.89%	71.11%
Teapot	28.95%	71.05%
Lamp	34.21%	65.79%
Vase	57.89%	42.11%

357 thought players have given to designing each part.

358 However, in the second part of the study, the collaboratively
359 modeled shapes were not categorized as being more “functional”
360 majority of the time. Feedback from the qualitative study re-
361 veals that the users tend to select a model designed by a single-
362 user as more functional due to its resemblance to a common,
363 more familiar design. Perhaps more importantly, the collabo-
364 ratively designed shapes were selected as more “creative while
365 remaining functional” by the majority of the users over all ob-
366 ject categories except for the vases, hence revealing users’ pref-
367 erence with the collaboratively created models overall. Vases
368 have a relatively simpler design when compared to other shape
369 categories. Hence the user may give preference to simplicity of
370 the design, over creative, yet somewhat complex designs, which
371 may have been the cause for the higher percentage of votes re-
372 ceived by the vases category.

373 In the second questionnaire, the user was presented with 6
374 to 8 shapes from one shape category, where half of the shapes
375 presented were modeled individually, while the other half were
376 modeled collaboratively. The user was asked to select “the
377 top three shapes (in order) that are creative, while remaining
378 functional”. The statistics acquired from this questionnaire (see
379 Table 3) shows the participants’ preference for collaboratively
380 modeled designs in most shape categories. Moreover, out of the
381 four shape categories presented to the user, the designs that re-
382 ceived the most votes consist of collaboratively designed shapes,
383 which are included in Figure 1.

384 After combining the responses received from both studies,
385 we conclude that our hypothesis is valid for the categories of
386 shapes being tested; hence, the designs produced using our col-
387 laborative modeling tool is effective in improving creativity,
388 while remaining functional compared to the designs produced
389 by a single user.

390 5. Discussion, limitations and future work

391 In this paper, we present a modeling tool, ExquiMo, which
392 assists users in designing creative 3D shapes. We build upon
393 the game of Exquisite Corpse, which is based on the idea of
394 collaboration. It combines the creative capabilities of multiple
395 players by allowing them to *co-creatively* design distinct parts
396 of a given shape. We increase the unexpectedness of the end
397 result by concealing the parts already being modeled, whereas
398 the coherency is maintained by revealing small portions of any

399 adjacent parts to the part being currently modeled.

400

401 **Limitations.** As a proof of concept, our tool was tested with
402 only six shape categories. However, one of the limiting factors
403 of ExquiMo is its inability to model shape categories containing
404 parts that are spanning in multiple directions. In such situations
405 the user requires the shape to be viewed in different angles for
406 the sketch-based modeling process, revealing the entire set of
407 parts modeled by the previous players on the same canvas. To
408 overcome this limitation, the tool can provide an option for the
409 players to draw in different canvases and combine the results
410 at the end of the game. Our tool is limited by the capabili-
411 ties of the underlying sketch-based modeling approach as well,
412 such as the requirement for smooth and closed 2D contours [9].
413 Currently, our tool is incapable of allowing users to collaborate
414 remotely. Hence, all the users should be present at one place
415 during the game play.

416

417 **Future work.** The approach we have introduced in this paper is
418 a preliminary attempt to bring in collaborative design to the cre-
419 ative modeling domain. Hence, there are many potential areas
420 to be explored when extending our modeling paradigm. First,
421 our current rudimentary part merging scheme can certainly be
422 improved with a more sophisticated state-of-the-art alignment
423 and merging scheme, which may require less interaction from
424 the user. Furthermore, a more detailed analysis of shapes can be
425 carried out as future work to identify the aspects of the models
426 that define the designs as creative. Our work attempts to gain a
427 certain level of functional stability by means of hints (i.e. con-
428 necting points). However, it may be helpful to study the impact
429 of hints on both functional stability and creativity alike.

430 Next, moving one step forward, a human-machine collabo-
431 ration [7] can be considered apart from a mere human-human
432 collaboration. Introducing such a blended collaboration may
433 help bridging the gap between generative systems, such as 3D
434 shape synthesis applications [15], and creativity support tools
435 for geometric modeling [23].

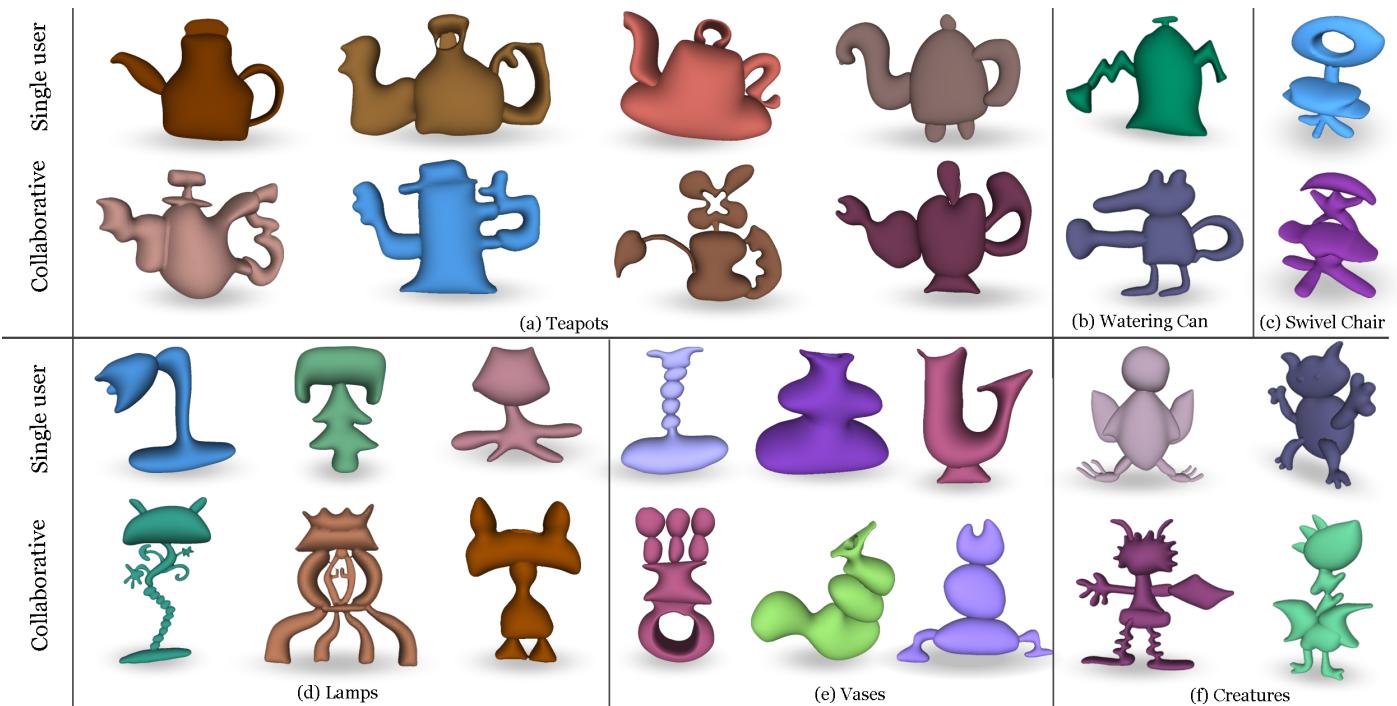

Figure 7: A sample of the shape categories modeled by a single user (top row), and multiple users (bottom row) using our tool, ExquiMo. Collaboratively modeled shapes were voted as “more creative, while remaining functional” by the participants of the user study.
