Let $f \in \mathbb{R}[x, y, z]$ be a homogeneous polynomial of degree d .
We define

$$\begin{aligned} \mathbb{R}X &= \{[x : y : z] \in \mathbb{RP}^2 \mid f(x, y, z) = 0\} \subset \mathbb{RP}^2 \\ \cap \\ \mathbb{C}X &= \{[x : y : z] \in \mathbb{CP}^2 \mid f(x, y, z) = 0\} \subset \mathbb{CP}^2. \end{aligned}$$

Let us assume f is non-singular, i.e., ∇f has no solutions
in $\mathbb{C}^3 \setminus 0$.

If $\mathbb{R}X \neq \emptyset$, then $\mathbb{R}X$ is a smooth compact manifold of real dimension 1.

Therefore,

$$\mathbb{R}X \underset{\text{homeo}}{\cong} \bigsqcup_1^k S^1, \quad k \geq 0.$$

The topology of $\mathbb{R}X$ does not depend entirely on its degree.
If the degree is odd, then $k \geq 1$.

If $\mathbb{R}X \neq \emptyset$, then $\mathbb{R}X$ is a smooth compact manifold of real dimension 1.

Therefore,

$$\mathbb{R}X \underset{\text{homeo}}{\cong} \bigsqcup_1^k S^1, \quad k \geq 0.$$

The topology of $\mathbb{R}X$ does not depend entirely on its degree. If the degree is odd, then $k \geq 1$.

Theorem (Harnack, 1876)

If X is a non-singular curve in \mathbb{RP}^2 of degree d , then

$$k \leq \frac{(d-1)(d-2)}{2} + 1.$$

Moreover, this bound is sharp.

Let X, Y be two non-singular plane curves of degree d .

$$(\mathbb{RP}^2, \mathbb{R}X) \cong (\mathbb{RP}^2, \mathbb{R}Y) \quad \text{if} \quad \begin{aligned} &\exists \varphi \in \text{Homeo}(\mathbb{RP}^2, \mathbb{RP}^2) \\ &\varphi(\mathbb{R}X) = \mathbb{R}Y. \end{aligned}$$

Since $\text{Homeo}(\mathbb{RP}^2, \mathbb{RP}^2)$ is connected, this is equivalent to:

$$\exists \varphi_t \in \text{Homeo}(\mathbb{RP}^2, \mathbb{RP}^2), 0 \leq t \leq 1,$$

$$\varphi_0 = \text{Id}_{\mathbb{RP}^2},$$

$$\varphi_1 = \varphi.$$

Equivalently, the sets $\mathbb{R}X, \mathbb{R}Y$ are isotopic as subsets of \mathbb{RP}^2 .

Given a degree d , classify the homeomorphism classes of pairs $(\mathbb{RP}^2, \mathbb{R}X)$, where $\mathbb{R}X \subset \mathbb{RP}^2$ is a non-singular curve of degree d .

Equivalently,

Given a degree d , classify all non-singular curves $\mathbb{R}X \subset \mathbb{RP}^2$ of degree d up to isotopy.

In such a family φ_t , every set $\varphi_t(\mathbb{R}X) \cong \mathbb{R}X$.

However, only $\varphi_0(\mathbb{R}X) = \mathbb{R}X$ and $\varphi_1(\mathbb{R}X) = \mathbb{R}Y$ are algebraic sets.

Imposing that $\varphi_t(\mathbb{R}X)$ is the real point set of a non-singular curve of degree d gives rise to the following notion.

In such a family φ_t , every set $\varphi_t(\mathbb{R}X) \cong \mathbb{R}X$.

However, only $\varphi_0(\mathbb{R}X) = \mathbb{R}X$ and $\varphi_1(\mathbb{R}X) = \mathbb{R}Y$ are algebraic sets.

Imposing that $\varphi_t(\mathbb{R}X)$ is the real point set of a non-singular curve of degree d gives rise to the following notion.

Definition

Two curves X, Y are *rigidly isotopic* if there exists an isotopy φ_t , $0 \leq t \leq 1$, from $\mathbb{R}X$ to $\mathbb{R}Y$ such that $\varphi_t(\mathbb{R}X)$ is the real point set of a non-singular curve of degree d .

Let us denote by \mathcal{C}_d the space of polynomials of degree d up to projective equivalence.

We call *discriminant* the subset $\mathcal{D}_d \subset \mathcal{C}_d$ of all singular curves. Within the discriminant \mathcal{D}_d , a generic curve has exactly one singular point, which is a nodal singular point.

$$\begin{array}{ccc}
 \mathbb{R}\mathcal{D}_d & \overset{\text{codim}_{\mathbb{R}}=1}{\subset} & \mathbb{R}\mathcal{C}_d \\
 \cap & & \cap \\
 \mathbb{C}\mathcal{D}_d & \overset{\text{codim}_{\mathbb{C}}=1}{\subset} & \mathbb{C}\mathcal{C}_d \\
 & \text{codim}_{\mathbb{R}}=2 &
 \end{array}$$

Let us denote by \mathcal{C}_d the space of polynomials of degree d up to projective equivalence.

We call *discriminant* the subset $\mathcal{D}_d \subset \mathcal{C}_d$ of all singular curves. Within the discriminant \mathcal{D}_d , a generic curve has exactly one singular point, which is a nodal singular point.

$$\begin{array}{ccc}
 \mathbb{R}\mathcal{D}_d & \xrightarrow{\text{codim}_{\mathbb{R}}=1} & \mathbb{R}\mathcal{C}_d \\
 \cap & & \cap \\
 \mathbb{C}\mathcal{D}_d & \xrightarrow[\text{codim}_{\mathbb{R}}=2]{\text{codim}_{\mathbb{C}}=1} & \mathbb{C}\mathcal{C}_d
 \end{array}$$

The connected components of $\mathbb{R}\mathcal{C}_d \setminus \mathbb{R}\mathcal{D}_d$ are called *chambers*. The classification of the chambers is equivalent to the classification of real curves up to rigid isotopy.

$(M-4)$ - perturbable curves

$(M-6)$ - perturbable curves

From now on, we assume that $X \subset \mathbb{RP}^2$ is a generic rational curve of degree 5. Thus, the curve X has a parametrization

$$\begin{array}{ccc} \mathbb{CP}^1 & \longrightarrow & \mathbb{CP}^2 \\ [u : v] & \longmapsto & [P(u, v) : Q(u, v) : R(u, v)], \end{array}$$

where P , Q and R are real homogeneous polynomials of degree d which do not have common zeros in \mathbb{CP}^1 .

A generic rational curve of degree d has $\frac{(d-1)(d-2)}{2}$ nodal singular points.

I obtain the rigid isotopy classification of nodal rational curves of degree 5 in \mathbb{RP}^2 using the fact that we can construct dessins by gluing building blocks and the correspondence

$\{\mathbb{R}X \subset \mathbb{RP}^2 \text{ marked nodal rational curves of degree 5}\} / \text{rigid isotopy}$

$\{D \subset \mathbb{D}^2 \text{ marked nodal dessins of degree 9}\} / \text{equiv. of marked dessins}$

Let $\Sigma \xrightarrow{\pi} B$ be a ruled surface endowed with an exceptional divisor E of negative self-intersection.

Let $C \subset \Sigma$ be a reduced irreducible curve such that

- $\pi|_C: C \rightarrow B$ is a morphism of degree 3,
- $C \cap E = \emptyset$.

We define the function

$$\begin{aligned} j_C: B &\rightarrow \mathbb{CP}^1 \\ b &\mapsto j\text{-inv}(\pi^{-1}(b) \cap (C \cup E)). \end{aligned}$$

Classification of rational degree 5 curves

Andrés Jaramillo Puentes

Introduction

Dessins

Rigid isotopy classification

Maximally perturbable curves

$(M - 2)$ -perturbable curves

$(M - 4)$ -perturbable curves

$(M - 6)$ -perturbable curves

$(M - 8)$ -perturbable curves

$(M - 10)$ -perturbable curves

$(M - 12)$ -perturbable curves

Theorem (JP)

There is a one-to-one correspondence between the rigid isotopy classes of marked nodal real rational curves of degree 5 and the equivalence classes of marked dessins on \mathbb{D}^2 with a fixed set of vertices.

Theorem (JP)

There is a one-to-one correspondence between the rigid isotopy classes of marked nodal real rational curves of degree 5 and the equivalence classes of marked dessins on \mathbb{D}^2 with a fixed set of vertices.

This gives rise to a classification of *marked* curves. From this we can easily deduce the rigid isotopy classification.

Classification of rational degree 5 curves

Rigid isotopy classification

Maximally perturbable curves

$(M - 2)$ -perturbable curves

$(M - 4)$ -perturbable curves

$(M - 6)$ -perturbable curves

$(M - 6)$ -perturbable curves

$(M - 6)$ -perturbable curves

Proposition (JP)

A nodal dessin D on \mathbb{D}^2 of degree at least 6 is weakly equivalent to the gluing of several building blocks.

Proposition (JP)

A nodal dessin D on \mathbb{D}^2 of degree at least 6 is weakly equivalent to the gluing of several building blocks.

Theorem (JP)

There is a one-to-one correspondence between the weak equivalence classes of degree 6 uninodal toiles and the chambers of generic real pointed quartic curves in their moduli space.

In order to present the rigid isotopy classification we introduce the following notion.

Definition

A *type I perturbation* X_0 of a nodal rational real curve X is a type I curve obtained by perturbing every elliptic node into an oval and every hyperbolic node into two real branches compatible with any orientation of X .

Definition

A nodal rational real curve of degree 5 is called $(M - s)$ -perturbable if it has a type I perturbation with $7 - s$ connected components.

Theorem (JP)

If X is a maximally perturbable real nodal rational curve of degree 5 in \mathbb{RP}^2 , then the rigid isotopy class of X is determined by its isotopy class and the position of its nodes with respect to the cyclic order of the ovals of a type I perturbation.

Let us denote by h_p the number of hyperbolic nodal points connecting the pseudoline to an oval in a type I perturbation of the curve.

Theorem (JP)

If $X \subset \mathbb{RP}^2$ is an $(M - 2)$ -perturbable nodal rational curve, its rigid isotopy class is determined by its isotopy class except for the following cases.
